RPDC causality $j \rightarrow i$ $\hat{\lambda}_{ij}(\omega) = N \hat{\mathbf{X}}_j(\omega)^* \hat{\mathbf{V}}_j(\omega)^{-1} \hat{\mathbf{X}}_j(\omega)$

Under the null hypothesis of $|A_{ij}(\omega)|^2 = 0$, $N \rightarrow \infty$, $\hat{\lambda}_{ij}(\omega) \rightarrow \chi^2_{k_i}$ distribution

RPDC can be directly used to measure the strength of causality from x_j to x_i at ω

$\chi^2_{k_i}$ $\hat{\lambda}_{ij}(\omega_2) < \hat{\lambda}_{ij}(\omega_1)$

$S_{max}(x_j) = \frac{1}{2\pi} \int_0^{2\pi} \hat{\lambda}_{ij}(\omega) d\omega$

Pattern Recognition Gernot A. Fink, Simone Frintrop, Xiaoyi Jiang, 2019-10-24 This book constitutes the proceedings of the 41st DAGM German Conference on Pattern Recognition DAGM GCPR 2019 held in Dortmund Germany in September 2019 The 43 revised full papers presented were carefully reviewed and selected from 91 submissions The German Conference on Pattern Recognition is the annual symposium of the German Association for Pattern Recognition DAGM It is the national venue for recent advances in image processing pattern recognition and computer vision and it follows the long tradition of the DAGM conference series Mapping Psychopathology with fMRI and Effective Connectivity Analysis

Baojuan Li, Adeel Razi, Karl J. Friston, 2017-06-22 There is a growing appreciation that many psychiatric and neurological conditions can be understood as functional disconnection syndromes as reflected in aberrant functional integration and synaptic connectivity This Research Topic considers recent advances in understanding psychopathology in terms of aberrant effective connectivity as measured noninvasively using functional magnetic resonance imaging fMRI Recently there has been increasing interest in inferring directed connectivity effective connectivity from fMRI data Effective connectivity refers to the influence that one neural system exerts over another and quantifies the directed coupling among brain regions and how they change with pathophysiology Compared to functional connectivity effective connectivity allows one to understand how brain regions interact with each other in terms of context sensitive changes and directed coupling and therefore may provide mechanistic insights into the neural basis of psychopathology Established models of effective connectivity include psychophysiological interaction PPI structural equation modeling SEM and dynamic causal modelling DCM DCM is unique because it explicitly models the interaction among brain regions in terms of latent neuronal activity Moreover recent advances in DCM such as stochastic and spectral DCM make it possible to characterize the interaction between different brain regions both at rest and during a cognitive task Studies at the Crossroads of Management & Economics

Frequency-domain Characterization of Power Distribution Networks Dr. Istvan Novak, Jason R. Miller, 2007. Power distribution networks (PDNs) are key components in today's high performance electronic circuitry. They ensure that circuits have a constant, stable supply of power. The complexities of designing PDNs have been dramatically reduced by frequency domain analysis. This book examines step by step how electrical engineers can use frequency domain techniques to accurately simulate, measure, and model PDNs. It guides engineers through the ins and outs of these techniques to ensure they develop the right PDN for any type of circuit. Circuit engineers gain valuable insight from the book's best practices for measuring, simulating, and modeling. Practical examples illustrate every phase in PDN development, from material characterization and component design to modeling the entire network.

Information-based methods for neuroimaging: analyzing structure, function and dynamics Jesus M. Cortés, Daniele Marinazzo, Miguel Angel Muñoz, 2015-05-07. The aim of this Research Topic is to discuss the state of the art on the use of information based methods in the analysis of neuroimaging data. Information based methods, typically built as extensions of the Shannon Entropy, are at the basis of model free approaches which, being based on probability distributions rather than on specific expectations, can account for all possible non-linearities present in the data in a model independent fashion. Mutual Information like methods can also be applied on interacting dynamical variables described by time series, thus addressing the uncertainty reduction or information in one variable by conditioning on another set of variables. In the last years, different information based methods have been shown to be flexible and powerful tools to analyze neuroimaging data with a wide range of different methodologies, including formulations based on bivariate vs multivariate representations, frequency vs time domains, etc. Apart from methodological issues, the information bit as a common unit represents a convenient way to open the road for comparison and integration between different measurements of neuroimaging data in three complementary contexts: Structural Connectivity, Dynamical Functional and Effective Connectivity, and Modelling of brain activity. Applications are ubiquitous, starting from resting state in healthy subjects to modulations of consciousness and other aspects of pathophysiology. Mutual Information based methods have provided new insights about common principles in brain organization, showing the existence of an active default network when the brain is at rest. It is not clear, however, how this default network is generated; the different modules are intra-interacting or disappearing in the presence of stimulation. Some of these open questions at the functional level might find their mechanisms on their structural correlates. A key question is the link between structure and function, and the

use of structural priors for the understanding of the functional connectivity measures As effective connectivity is concerned recently a common framework has been proposed for Transfer Entropy and Granger Causality a well established methodology originally based on autoregressive models This framework can open the way to new theories and applications This Research Topic brings together contributions from researchers from different backgrounds which are either developing new approaches or applying existing methodologies to new data and we hope it will set the basis for discussing the development and validation of new Information based methodologies for the understanding of brain structure function and dynamics
