Performance Analysis of Memory Transfers and GEMM Subroutines on NVIDIA Tesla GPU Cluster, 2009 Commodity clusters augmented with application accelerators are evolving as competitive high performance computing systems The Graphical Processing Unit GPU with a very high arithmetic density and performance per price ratio is a good platform for the scientific application acceleration In addition to the interconnect bottlenecks among the cluster compute nodes the cost of memory copies between the host and the GPU device have to be carefully amortized to improve the overall efficiency of the application Scientific applications also rely on efficient implementation of the Basic Linear Algebra Subroutines BLAS among which the General Matrix Multiply GEMM is considered as the workhorse subroutine In this paper they study the performance of the memory copies and GEMM subroutines that are critical to port the computational chemistry algorithms to the GPU clusters To that end a benchmark based on the NetPIPE framework is developed to evaluate the latency and bandwidth of the memory copies between the host and the GPU device The performance of the single and double precision GEMM subroutines from the NVIDIA CUBLAS 2.0 library are studied The results have been compared with that of the BLAS routines from the Intel Math Kernel Library MKL to understand the computational trade offs The test bed is a Intel Xeon cluster equipped with NVIDIA Tesla GPUs
