Data Subject to Change Without Notice

These guidelines have been formulated to ensure proper application of generator drive engines in A.C. generator set installations.

**STANDBY POWER RATING:** Applicable for supplying emergency power for the duration of the utility power outage, the overrated capability is available for this rating. Under no condition is an engine allowed to operate in parallel with the public utility at the Standby Power rating. This rating should be applied where reliable utility power is available. A Standby rated engine should be rated for a maximum of an 75% average load factor and 200-hours of operation per year. This includes less than 5 hours per year at the Standby Power rating. Standby ratings should never be applied except in true emergency power outages. Regulated power outages contracted with a utility company are not considered an emergency.

Reference AEB 16.47 for determining Electrical Output.

Data shown above represents gross engine performance capabilities obtained and corrected to accordance with ISO 3081 conditions of 100 kPa (29.53 in Hg) barometric pressure (760 mm (29.53 in) Hg) air and engine speed, and relative humidity of 30%, with No. 2 diesel oil at a fuel corresponding to ASTM D92.

Derate values are based on 15 in Hg air intake restriction and 5 in Hg exhaust back pressure.

This test configuration data is based on No. 2 diesel fuel weight and 60 kg/litre (12.1 lbs) U.S. gal. Power output curves are based on the engine operating with fuel, coolant, water pump and lubricating oil supply, not including air battery, charging alternator, fan, mechanical equipment and driver components.
