## Advanced Swift Objc Io:

**Verified Functional Programming in Agda** Aaron Stump, 2016-02-01 Agda is an advanced programming language based on Type Theory Agda's type system is expressive enough to support full functional verification of programs in two styles In external verification we write pure functional programs and then write proofs of properties about them The proofs are separate external artifacts typically using structural induction In internal verification we specify properties of programs through rich types for the programs themselves This often necessitates including proofs inside code to show the type checker that the specified properties hold The power to prove properties of programs in these two styles is a profound addition to the practice of programming giving programmers the power to guarantee the absence of bugs and thus improve the quality of software more than previously possible *Verified Functional Programming in Agda* is the first book to provide a systematic exposition of external and internal verification in Agda suitable for undergraduate students of Computer Science No familiarity with functional programming or computer checked proofs is presupposed The book begins with an introduction to functional programming through familiar examples like booleans natural numbers and lists and techniques for external verification Internal verification is considered through the examples of vectors binary search trees and Braun trees More advanced material on type level computation explicit reasoning about termination and normalization by evaluation is also included The book also includes a medium sized case study on Huffman encoding and decoding
