What Is a Galaxy?

Read the passage and answer the questions.

A galaxy is a massive system of stars, stellar remnants, interstellar gas, dust, and dark matter all bound together by gravity. Galaxies come in various shapes and sizes and the most common form is being spiral galaxies. Other common galaxy shapes include elliptical galaxies, irregular galaxies, and dwarf galaxies.

The Milky Way is the galaxy that contains our solar system and is classified as a barred spiral galaxy. It is estimated to have over 100 billion stars and spans about 100,000 light years in diameter. Locally, our own galaxy has a central supermassive black hole and several smaller supermassive black holes. Other galaxies can be seen in the night sky through telescopes. Some galaxies are very far away, such as galaxies that are billions of light years away. These galaxies are held together by their own gravity.

Galaxies are crucial to understanding the universe's structure and evolution. They are the building blocks of the universe, and studying them can provide insight into the formation of stars and planetary systems. Observing distant galaxies allows astronomers to look back in time to the light from these galaxies, which is called the cosmic microwave background. This helps scientists understand the history of the universe and its evolution.

The study of galaxies has advanced significantly with the development of powerful telescopes and space observatories. Astronomers use the Hubble Space Telescope, the James Webb Space Telescope, and other observatories to study galaxies and their evolution. They also use computer simulations to model the formation and evolution of galaxies. This research has led to a better understanding of the universe and its evolution.

Understanding galaxies not only enhances our knowledge of the universe but also inspires curiosity about our place in it. Each galaxy is a vast and diverse system that we hope to explore and understand in the future.

Fill in the Blanks
