Seismic Design of Base-isolated Highway Bridges Utilizing Lead-rubber Bearings ,1990 A study is made of the seismic behaviour of base isolated highway bridges with the objective of developing design procedures in the form of code type approach The recommendations of current codes concerning the use of energy dissipation mechanisms for the seismic design of bridges are reviewed A model representing the bridge deck piers and the base isolation system is used to evaluate the response of the bridge to a selected earthquake time history record and to evaluate the effects of various design parameters on the dynamic response The results of this analysis are used in the development of design guidelines for the isolated bridge system It was found that base isolation affects the design forces on piers and abutments as well as the deck displacements An optimum design should provide a reasonable balance between the shear forces on supports and tolerable displacements Two design procedures are proposed based on the time history and inelastic response spectra approaches Simplified charts are presented which aid in the seismic design of new bridges as well as in the upgrading of existing ones

Design Examples ,2003 Proceedings of ATC-17-1 Seminar on Seismic Isolation, Passive Energy Dissipation, and Active Control: Seismic isolation systems ,1993 *An Introduction to Seismic Isolation* R. Ivan Skinner,William H. Robinson,Graeme H. McVerry,1993-07-06 These authors present much sought after information on the design procedures for seismically isolated structures Using a logical progression they describe seismic isolation along with the concepts of earthquake structural dynamics underlying the isolation theory Methods discussed will provide the basis for continuing development and refinement **Design, Analysis, and Seismic Performance of a Hypothetical Seismically Isolated Bridge on Legacy Highway** Keri Lynn Ryan,Brian Richins,2011 The need to maintain the functionality of critical transportation lifelines after a large seismic event motivates the strategy to design certain bridges for performance standards

beyond the minimum required by bridge design codes To design a bridge to remain operational one may stiffen and strengthen the load carrying members to increase the capacity or alternatively use response modification devices such as seismic isolators to shift the dynamic characteristics of the bridge henceforth reducing the seismic demands Seismic isolation systems are attractive because they are directly conducive to accelerated bridge construction techniques The two strategies are compared for a typical Utah highway bridge using a three span pre stressed concrete girder bridge that crosses Legacy Highway as a case study example

Sources of Information in Highways John B. Gallwey, 2007 Compiled by members of the Transportation Division of the Special Libraries Association this bibliography is part of the 6th edition of the Division's Sources of Information in Transportation The new edition will become available on the National Transportation Library website <http://ntl.bts.gov> in summer 2007

Bridge Engineering W.F. Chen, Lian Duan, 2003-02-27 Mitigating the effects of earthquakes is crucial to bridge design With chapters culled from the best selling Bridge Engineering Handbook this volume sets forth the principles and applications of seismic design from the necessary geotechnical and dynamic analysis background to seismic isolation and energy dissipation active control and retrofit

Performance-based Seismic Bridge Design M. Lee Marsh, Stuart Judson Stringer, 2013 TRB's National Cooperative Highway Research Program NCHRP Synthesis 440 Performance Based Seismic Bridge Design PBSB summarizes the current state of knowledge and practice for PBSB PBSB is the process that links decision making for facility design with seismic input facility response and potential facility damage The goal of PBSB is to provide decision makers and stakeholders with data that will enable them to allocate resources for construction based on levels of desired seismic performance Publisher's description

Seismic Retrofitting Manual for Highway Bridges, 1995 This manual is an interim revision of the Federal Highway Administration FHWA publication Seismic Retrofitting Guidelines for Highway Bridges which was published in 1983 as report number FHWA RD 83 007 It describes an evaluation procedure for retrofitting seismically deficient highway bridges and outlines various measures to upgrade these structures The guidance provided in this manual is comprehensive in nature and nationally applicable to bridges in different seismic zones It includes a revised preliminary screening procedure two methods of detailed evaluation which include the capacity demand ratio method and the lateral strength method and expanded sections on retrofit measures for bearings columns footings foundations and soils A new section on the application of seismic isolation to bridge retrofit is also included The manual is termed an interim revision because the subject matter is still evolving at this time

Seismic Isolation and Energy Dissipation, 1990 Proceedings, 1994 Annual Task Group Technical Session Structural Stability Research Council. Technical Session, 1994

Seismic Behaviour of Highway Bridges with Base Isolation, 1988 A study is made on the seismic behaviour of highway bridges with lead rubber isolation the system of base isolation is considered as a bilinear spring single and twin span highway bridges subjected to representative strong earthquake ground motion records were analyzed the effect of various parameters such as the isolator's stiffness pier stiffness and pier eccentricity on the

system response was evaluated it was found that the use of base isolation shifts the fundamental frequency of the bridge system towards the longer period proper design of the base isolation tends to reduce the design forces on the bridge piers and is accompanied by larger displacements simplified design guidelines are adequate as long as the bridge system can be represented by a single degree of freedom model the reduction in pier stiffness of a two span bridge may increase the displacement and the force transmitted the abutment the increased forces at the abutments are accompanied by reduction in the shear force transmitted to the pier increased displacements and forces may also result when the location of the pier departs from the centre and unequal spans are created in this case the maximum displacements and forces occur at the abutment adjacent to the long span Seismic Isolation of Highway Bridges ,2006 *Technical Report* ,2008
