### **INTRODUCTION**

#### **Need for the protected water supply:**

The water when exposed to the atmosphere contains many impurities which are harmful to any living organism. If untreated water is consumed by living organisms it is likely to cause serious harm to their health hence in order to make water potable and free from various impurities purification methods are found out.

The soul of purification process of present day water supply schemes is the filtration. It is preceded by pre filtration purification methods and followed by post filtration purification methods. The former methods make the water fit for filtration and the latter methods treat the impurities which have not been removed with the help of the process of filtration. The line of treatment to be recommended for a particular quantity of water will naturally depend upon its quality.

The water covers about three quarters of our planet and yet it is said to note that about 70 % of the world's population survive without clean water. The un served population is largely existing to the extent of about 50 % in India, Pakistan and Bangladesh. India alone contributes 30 % to 35 % of the un served population.

#### **Types of water demands**

##### **Domestic demand:**

Drinking human body contains about 70% of water consumption of water by a man is required for various physiological processes blood formation food assimilation its the quantity of water which a man would require for drinking depends on various factors but on the average and under normal conditions it is about to liters birthday this amount as will be seen is very small as compared to various other uses of water but it is most essential to supply water for drinking purposes with a high degree of purity of water for drinking contains undesirable elements with mildly to epidemic in fact the drinking water should be protected potable and palatable.

##### **Cooking:**

Some quantity of water will also be required for cooking the quantity of water required for this purpose will depend upon the stage of advancement of the family in particular and Society in

Mapping Water in a Small Town: Insights from Chintamani, Karnataka Rajesh Ramamoorthy, Shreya Nath, Shashank Palur, Cheshta Rajora, Muhil Nesi, Ashwin Kumar, Ganashree KS, Naveen Kumar, Jeevan Roy, Sapna Manjunath, 2024-03-22

India's urbanisation narrative is entering a new phase one in which the significance of small and medium towns is on the rise. The government's establishment of industrial parks in and around towns combined with the increasing prevalence of remote work is shaping a transformed India where small towns assume a more pivotal role. Currently, small and medium towns characterised by populations below 100,000 account for 44.2% of the overall urban area in India and constitute 26% of the nation's total urban population. Despite this transition, significant attention and resources continue to be directed towards large metropolises, neglecting towns and peri-urban areas. As a result, many towns grapple with meeting the requirements and ambitions of their growing populations, lacking essential infrastructure for even fundamental services, particularly in water and sanitation. Small towns could play a crucial role in advancing India's economic growth, but addressing their water and sanitation challenges is key for sustained development. According to a 2021 Niti Aayog report, over half of the 7,933 urban settlements in India lack any master plan. The absence of a comprehensive planning approach for cities and towns results in challenges for surface water bodies, natural drainage systems, and floodplains, which are vital components for ensuring water resilience. Limited financial resources, staffing, and technical capacity pose significant challenges for most small and medium towns in managing water and sanitation issues. This often prompts towns to address immediate needs through short-term measures, resulting in a disjointed collection of piecemeal interventions that fail to function as a unified system. These fragmented systems will be more susceptible to issues like water scarcity, droughts, and extreme weather events in regions prone to climate variability. To understand the problems and potential solutions to these water and sanitation systems, we studied the town of Chintamani. Like many other small towns in India, Chintamani lacks access to a major river and relies on groundwater. It is situated in the Deccan Plateau to the north of the capital, Bengaluru, in Karnataka. Our involvement in Chintamani commenced with an effort to understand the issues by first engaging in discussions with municipal officials and elected representatives. From June to December 2022, spanning a six-month period, we conducted primary data collection through household surveys, gathered municipal records, and sought to address information gaps through interactions with Chintamani City Municipal Council (CMC) officials. Our analytical framework centred around the urban water balance, which provides a quantified basis for urban flows, water resources, feeding the city, areas of significant usage, losses, discharge, and storage. This exercise proved useful when we applied it in the context of Bengaluru, which is already confronted with extremes of water scarcity and flooding. But regardless of location, the process of creating an urban water balance reiterates that water management cannot be done in a siloed manner because of the interdependence of different systems. A comprehensive view of all the flows and stores of water is a necessary starting point to narrow down on key problem areas.

and potential opportunities Through this analysis we found that Chintamani is plagued by challenges related to both groundwater and surface water management It also highlighted the town s financial precarity a problem not unique to Chintamani but documented on a nationwide scale municipalities simply do not earn enough revenue to meet their rising expenditure and are increasingly reliant on state and central government grants
