K. Bandyopadhyay,S. K. Chaulya,P. K. Mishra,2009-08-29 Wireless communication has emerged as an independent discipline in the past decades Everything from cellular voice telephony to wireless data transmission using wireless sensor networks has profoundly impacted the safety

production and productivity of industries and our lifestyle as well. After a decade of exponential growth, the wireless industry is one of the largest industries in the world. Therefore, it would be an injustice if wireless communication is not explored for the mining industry. Underground mines, which are characterized by their tough working conditions and hazardous environments, require fool-proof, mine-wide communication systems for the smooth functioning of mine workings and ensuring better safety. Proper and reliable communication systems not only save the machine breakdown time but also help in the immediate passing of messages from the vicinity of the underground working area to the surface for day-to-day normal mining operations as well as for speedy rescue operations in case of disaster. Therefore, a reliable and effective communication system is an essential requisite for safe working and maintaining requisite production and productivity of underground mines. Most of the existing systems generally available in underground mines are based on line-wired communication principles; hence, these are unable to withstand disaster conditions and difficult to deploy in inaccessible places. Therefore, wireless communication is an indispensable, reliable, and convenient system and essential in case of day-to-day normal duty or disaster situations.

Full-Duplex Wireless Communications Systems Tho Le-Ngoc, Ahmed Masmoudi, 2017-07-02. This book introduces the development of self-interference (SI) cancellation techniques for full-duplex wireless communication systems. The authors rely on estimation theory and signal processing to develop SI cancellation algorithms by generating an estimate of the received SI and subtracting it from the received signal. The authors also cover two new SI cancellation methods using the new concept of active signal injection (ASI) for full-duplex MIMO-OFDM systems. The ASI approach adds an appropriate cancelling signal to each transmitted signal such that the combined signals from transmit antennas attenuate the SI at the receive antennas. The authors illustrate that the SI pre-cancelling signal does not affect the data-bearing signal. This book is for researchers and professionals working in wireless communications and engineers willing to understand the challenges of deploying full-duplex and practical solutions to implement a full-duplex system. Advanced-level students in electrical engineering and computer science studying wireless communications will also find this book useful as a secondary textbook.
