Abstract

A new scale for motor function measurement has been developed for neuromuscular diseases. The validation study included 303 patients, aged 6–62 years. Seventy-two patients had Duchenne muscular dystrophy, 32 Becker muscular dystrophy, 30 limb-girdle muscular dystrophy, 39 facio-scapulo-humeral dystrophy, 29 myotonic dystrophy, 21 congenital myopathy, 10 congenital muscular dystrophy, 35 spinal muscular atrophy and 35 hereditary neuropathy. The scale comprised 32 items, in three dimensions: standing position and transfers, axial and proximal motor function, distal motor function. Agreement coefficients for inter-rater reliability were excellent ($\alpha=0.81$ – 0.94) for nine items, good ($\alpha=0.61$ – 0.80) for 20 items and moderate ($\alpha=0.51$ – 0.60) for three items. High correlations were found between the total score and other scores: Vignos ($r=0.91$) and Brooke ($r=0.85$) grades, Functional Independence Measure ($r=0.91$), the global severity of disability evaluated with visual analog scales by physicians ($r=0.88$) and physiotherapists ($r=0.91$). This scale is reliable, does not require any special equipment and is well-accepted by patients. Its sensitivity to change is being assessed to permit its use in clinical trials of neuromuscular diseases.

1. Introduction

In neuromuscular diseases, identification of new genotypes and hope for gene therapy have obliged scientists and clinicians to collaborate in order to classify phenotypes more precisely and to link them to specific genetic defects. Evaluation of motor deficit, and in particular measurement of muscle force by muscle testing or instrumental measures, is the most frequently used evaluation [1,2]. However, this muscle testing does not reflect the subject's functional abilities. These depend on the heterogeneity of the muscle defect, the muscular compensations and the limitations of the joints.

Several tests for the measurement of motor function have been proposed: the Functional Motor Scale for spinal

muscular atrophy (SMA) [3]; the ALS score [4], the Tufts Quantitative Neuromuscular Exam [5] and the Amyotrophic Lateral Sclerosis Functional Rating Scale [6] for amyotrophic lateral sclerosis; the Hughes Functional Score [7] for Guillain-Barré syndrome and the Hammersmith Motor Ability Score [8] for Duchenne muscular dystrophy (DMD). Some tests focus on the function of one part of the body: the Zupan Functional Test [9] or the Brooke Upper Extremity Scale [11] for the upper limbs and the Vignos Lower Extremity Scale for the lower limbs [10]; other tests specifically address a single medical question such as the Diagnostic Motor Performance Test [11] for establishing the differential diagnosis between myopathy and neuropathy. Some have not been validated: Timed tasks [1] and others are non-specific such as the Jobben Hand Function Test [12], or have not been adapted or validated for neuromuscular diseases, like the Gross Motor Function Measure which has been validated for cerebral palsy [13]. At the moment, there is no well validated test which is easy to administer and which has been adapted for the objective

Companion to Clinical Neurology William Pryse-Phillips, 2009-06-03 This book is designed for the neurologist who in this day of unusually strict accountability needs to have at hand an authoritative guide to the diagnostic criteria for all conditions that he or she may be faced with in clinical practice While originally conceived as a compendium of diagnostic criteria the author has felt the need to expand the work to include definitions of practically all terms that are used in neurology today Historical elements are also provided including entries of important neurologists and neurosurgeons who have impacted the field The result is an effective representation of the tools of the trade for the neurologist in training and a concise and precise source for the practicing neurologist The second edition was published in 2003 Since then advances in the definition of many neurological conditions have been made all of which have been incorporated in the third edition There has also been a fine tuning of the definitions and diagnostic criteria of many other conditions The author has collated over 1300 articles since the last edition in order to update many of the entries As such the entries will have the most up to date definition of diseases symptoms diagnostic tests and pearls of wisdom The third edition remains an invaluable guide to the spectrum of neurological practice and with nearly 7 000 references this truly is the bible of neurological terms and conditions
