Newnan, 2004 This volume is a study guide for the civil engineer taking the PE exam Solved problems throughout each chapter reinforce the concepts discussed in the text

*Mechanistic Evaluation and Calibration of the AASHTO Design Equations and Mechanistic Analysis of the SHRP Asphalt Surfaced Pavement Sections* Gilbert Y. Baladi, 1994 Mechanistic evaluation of the American Association of State Highway and Transportation Officials AASHTO flexible design equations was conducted by using 243 artificial pavement sections with various layer properties roadbed soil modulus and traffic volumes A mechanistic based modification procedure of the effects of the AASHTO drainage coefficient is presented A

nomograph for estimating the effects of drainage coefficients on the expected life of the pavement structures is also presented and discussed Finally the results of the backcalculated layer moduli of some of the Strategic Highway Research Program asphalt surfaced General Pavement Studies sections are presented and the accuracy of the values briefly discussed

*ACI Manual of Concrete Practice*, 2005 Fifth International Conference on the Structural Design of Asphalt Pavements, 1982 **Proceedings**, 1982 Experimental Assessment of Aggregate Surfacing Materials Robert Mokwa, 2007 An extensive suite of geotechnical laboratory tests were conducted to quantify differences in engineering properties of three crushed aggregates commonly used on Montana highway projects The material types are identified in the Montana Supplemental Specifications as CBC 6A CBC 5A and CTS 2A Results from R value tests and direct shear tests performed on large samples 12 in by 12 in indicates the CBC 6A aggregates generally exhibited the highest strength and stiffness of the three material types In terms of strength parameters there was no statistically significant difference between CBC 5A and CTS 2A materials The CBC 6A and 5A materials exhibited similar average R values which were both slightly greater than the CTS 2A materials Overall the CTS 2A materials generally exhibited the lowest average strength and stiffness Although this material was the poorest performer when compared to the two CBC materials it still exhibited relatively high strength and stiffness Drainage capacity was quantified by conducting multiple saturated constant head permeability tests on 10 inch diameter samples of each material type The CBC 6A and CTS 2A materials had the highest average permeability values while the CBC 5A materials had the lowest Permeability was shown to depend more on the fine fraction void ratio  $e_{sub f}$  than on aggregate type or maximum particle size An analytical method of predicting permeability based on  $e_{sub f}$  was developed which will allow Montana Department of Transportation designers to estimate permeability based on gradation and state of compaction Overall the CBC 6A materials were generally the best performers in this study In general the CBC 5A aggregates exhibited the second highest strength and stiffness but also had the lowest drainage capacity The CTS 2A aggregates exhibited the lowest strength and stiffness but had relatively good drainage capacity The ability to substitute CTS 2A material for CBC aggregates depends on the relative importance that is assigned to strength stiffness and drainage in the pavement design model

A study has been conducted to evaluate and analyze portland cement concrete PCC pavements in order to develop recommendations for the design and construction of long lived concrete pavements It involved a detailed evaluation and analysis of the PCC pavement data in the Long Term Pavement Performance LTPP database using statistical techniques to determine the design features and construction practices that have a beneficial effect on long term performance The study focused on the development of practical recommendations that can be easily implemented by highway agencies to increase pavement life This volume describes and provides information on design features and construction practices that improve pavement performance A key focus was to develop canonical discriminant functions that can be used to discriminate between groups of pavements in the sense of being able to tell them apart The pavements were grouped according to their performance classification namely above expectation as expected and below expectation The canonical functions consist of linear combinations of the variables that describe and quantify the pavement design features site conditions and construction practices I This report is the second in a series of three volumes on the study The other volumes are as follows FHWA No Vol No Short Title FHWA RD 98 052 I Summary of Design Features and Construction Practices That Influence Performance of Pavements FHWA RD 98 113 I11 Improved PCC Performance Models Technical report documentation page
