[Applied Data Analytics and Diagnostics](#)

Posted: June 14, 2024

The power industry is undergoing a digital transformation to derive benefit from mass collection and utilization of data. Machine Learning, Neural Networks, Advanced Pattern Recognition (APR), and Artificial Intelligence hold substantial promise to create solutions for future power generating utilities.

Effective monitoring and diagnostics and prognostics approaches require the utilization of plant data and analytical techniques. Advanced analytical approaches utilize data from various sources, from traditional structured sources such as field sensors, to unstructured sources that include work order data, operator round data, data in text format, pictures, and transient data, can be integrated to support advanced diagnostics and prognostics.

The objective of this project is to develop methods and approaches in support of applied advanced data analytics, diagnostics, and prognostics to help provide improvement solutions that address generation-based challenges in the areas of productivity, reliability, and safety.

[Process and Integration](#)

Posted: June 14, 2024

The industrial work environment is evolving rapidly with advances in mobile computing and communication technology, deployment of additional sensors both wired and wireless, application of advanced diagnostic and analytic models, and integration of data in various forms and applications. Changes in the way is data is acquired, how it is used, and how it is accessed are driving utilities to re-evaluate the way they have traditionally approached operations and maintenance functions. Anticipated benefits from the influx of new technology and capability includes improved equipment reliability and workforce effectiveness.

As the "digital transformation" (DX) progresses in the power industry, utilities are also challenged with changing business models, shifting operational strategies of large-scale generation, and a shrinking workforce. The convergence of these changes creates opportunities as well as challenges. In the past, benefits have been realized from adoption of individual technology and/or standalone analytic capabilities; however, it is an expectation that the integration of various advanced technologies and connectivity across functions holds significant and sustained benefit over and above what can be achieved through standalone efforts. The "ease" of doing business and performing the correct work at the right time with less staff in the face of increased operational demands is a high-level example where integration, connectivity, and adoption of technology are key parts of the evolving generation landscape.
