Dc Motor Speed Control Using Pid Controllers:

PID Digital Controller for DC Motor Speed Using MC68HC11 Microcontroller Sharon Peterus, 2008 The proportional integral derivative PID controllers are widely used in many industrial control systems for several decades since Ziegler and Nichols proposed their first PID tuning method This is because the PID controller structure is simple and its principle is easier to understand than most other advanced controllers On the other hand the general performance of PID controller is satisfactory in many applications For these reasons the majority of the controllers used in industry are of PI PID type PID controllers are widely used for process control applications requiring very precise and accurate control The purpose of the motor speed controller is to take a signal representing the demanded speed and to drive a motor at that speed The controller does not actually measure the speed of the motor Thus it is called an Open Loop Speed Controller Motors come in a variety of forms and the speed controller's motor drive output will be different dependent on these forms The speed controller presented here is designed to drive special dc motor which is not easily available anywhere in store thus it is a good example to be used due to the special characteristics and parameters Matlab Simulink is an important tool used in this project from designing the mathematical model of the dc motor obtaining the transfer function and designing the PID controller using both model and programming using m files The transfer function will be linearized and used for tuning the gain of PID controller like KP KI and KD Simulink is chosen to simulate the performance of the control system Speed Control of DC Motor Using PID Controller Implementation with Visual Basic Nurul Izzati Pandak Jabo, 2008 The project focused on speed control of DC motor The main objective is to design and develop GUI software for speed control experiment where PID controllers design approaches has been applied The controllers have been designed and the system is simulated using MATLAB to analyze their initial performance The computer is connected to DC Motor via data acquisition card DAQ Card and Visual Basic is used to conduct the experiment Field testing is implemented to compare the results between the original and modified system with the PID controller Finally the performance of the system is analyzed and validation is done in terms of time response robustness and percentage of error *Practical Control Engineering for Mechatronics and Automation* Fernando Martell, Irma Y. Sanchez, 2024-06-14 Production processes and engineered systems use continuous and discrete variables as well as the combination of continuous and sequential operations This volume covers both aspects thus providing knowledge in continuous and discrete control logic control and hybrid control systems It is a compilation of selected control strategies to automate processes and systems with a practical approach to ease their design analysis and implementation The selection of the control schemes is based on the capability to provide desired dynamical response or real time performance Practicality is required for achieving faster development times of automation projects or system prototypes by comprehensive presentation and direct application of methodologies and techniques for efficient and structured programming of control algorithms Considered methodologies include model based design hardware in the loop simulations and structured

programming Fundamental signals and systems concepts are explained Systems and controllers are analyzed using discrete time equations which ease their implementation in most programmable platforms without requiring sophisticated software PID based control internal model control and model reference control are viewed as powerful schemes in terms of performance and suitability for mechatronics systems because of the use of the model in their architecture as a key control element Finite state machines are presented to solve sequential requirements of direct and supervisory control of many processes and machines Cyberphysical systems are an industrial technology and an education trend distinguished by visual and dynamic models or digital twins of the physical systems The discussed analysis design and implementation practices are integrated and applied in the context of cyberphysical systems This book aims to provide multidisciplinary support to engineers and practitioners in the design of control systems and is a valuable tool for automation teaching and self learning

Acceleration Slip Regulation (ASR) System Using PID-FI Controller Hisao Matsuka,1997
A DC Motor Controller Using PID Algorithm Implementation on PIC Wan Robaah W Ahmad,2008 This project is about controlling the speed of DC servo motor by using Proportional Integral Derivative PID algorithm then implemented on Peripheral Interface Circuit PIC microcontroller The main objective of this project is to control the speed of DC servo motor at the demanded speed or to drive the motor at that speed The speed of a DC motor usually is directly proportional to the supply voltage So if we reduce the supply voltage from 12 Volts to 6 Volts the motor will run at half the speed It could be achieved by simply adjusting the voltage sent to the motor but this is quite inefficient to do So A PID controller becomes the best way to overcome this problem PID attempts to correct the error between a measured process variable and a desired setpoint by calculating and then outputting a corrective action that can adjust the process accordingly In this project the PID algorithm that is added to the system becomes a closed loop system A simulation using MATLAB software is implemented to tune PID algorithm by changing the value of Proportional gain K_p Integral gain K_i and Derivative gain K_d to get a speed of the motor which is less overshoot and increase settling time Then a PIC microcontroller is programmed by adding the value of tuned PID algorithm to control the speed of DC servo motor At the end of the project the speed of the DC servo motor should be maintain even the supply voltage is varied
