*Digital Remote Patient Monitoring in Neurodegenerative Diseases* Graham Jones, Amit Khanna, Diane Stephenson, 2026-01-06  
The development of sensitive miniature electronic digital health sensors has stimulated growth of a multi-billion-dollar consumer products for the health tech industry. Devices like wrist and finger-worn wearables, smartphones, specialized peripherals, and home-based IoMT devices are capable of utilizing these technologies coupled with associated algorithms to accurately measure vital signs, cognitive functions, and fine motor movements. This now opens the opportunity for measuring subtle changes in chronic degenerative diseases using a suite of digital tools with the potential to detect a change within a reasonable time during the early course of the disease. These slowly progressing conditions manifest clinical symptoms and functional impairment over a period of several years. Thus, deploying technologies to facilitate early diagnosis, characterization, and monitoring disease progression longitudinally might enable informed decisions on treatment, care, and early interventions. They can also provide key data to underscore the efficacy of therapeutics designed to prevent delay or modify the course of the disease, addressing an unmet need in this area and generating data of relevance to the regulatory authorities and payors. The need for use of such technologies is becoming acute as the rising prevalence of diseases such as Alzheimer's, Parkinson's, and multiple sclerosis represent an enormous societal, economic, and healthcare burden globally. In this Research Topic, we will highlight recent developments in remote patient monitoring derived from experts in the academy, pharmaceutical industry, government laboratories, and research foundations. Examples range from routine measurements of blood pressure, heart rate variability, and sleep cycles to more complex interrogation of acoustic, oculomotor, and ballistographic signals which can provide insight into disease states to enable early intervention. Additionally, specialized digital programs can give insight into cognitive state and function. If captured longitudinally, they can provide informative data on disease progression and classification. A benefit of digital monitoring in the early stages of disease lies in the potential to explore disease-preventing approaches during limited time periods of a clinical study and offer long-term monitoring via registries and electronic health records. Based on the considerable promise of these digital technologies, we are delighted to showcase cutting-edge advances and emerging directions in the field through this exciting collection, which we cordially welcome authors to consider submitting to. Potential topics could include, but are not restricted to, the following subject areas: Use of digital technologies to facilitate early diagnosis, characterization, and monitoring of neurodegenerative disease; Data-driven approaches to interrogate the efficacy of symptomatic and disease

modifying therapies Development of standards and metrics to guide registration validation and regulatory approaches Future remote monitoring environments from clinical studies to IoMT at home Ethical considerations around the capture storage transmission and ownership of patient captured data Clinical and real world evaluation of sensors and sensing technologies in neurodegenerative disease Progress in human factor engineering in the design of patient friendly remote monitoring devices Passive versus active monitoring the impact of patient friction burden on longitudinal data capture Strategies to align and translate patient voice into clinical meaningfulness measures

Physio-logging in Humans: Recent Advances and Limitations in Wearable Devices for Biomedical Applications Mohammad Yavarimanesh, Colin K. Drummond, Cederick Landry, 2025-08-29 The recent advancements in wearables nearables and machine learning have paved the way for unparalleled approaches to monitoring physiological parameters These approaches show great potential in studying human physiology during daily life as well as in extreme conditions such as astronaut monitoring and human performance In addition wearables and recent advances in physio logging can alleviate the impact of numerous diseases and medical conditions globally and therefore have the potential to reduce the cost of healthcare and increase patients quality of life Noteworthy strides have already been accomplished evoking enthusiasm among patients and researchers alike but very few wearable solutions have reached their anticipated potential due to many limitations such as sensor interoperability fit comfort adverse reaction to wearables lack of design standards and validation guidelines By curating an article collection that brings together explored avenues to monitor physiological parameters that did or did not work it is anticipated that further progress in the field can be accelerated
