Simulating Combustion Günter P. Merker, Christian Schwarz, Gunnar Stiesch, Frank Otto, 2005-12-17 The numerical simulation of combustion processes in internal combustion engines including also the formation of pollutants has become increasingly important in the recent years and today the simulation of those processes has already become an indispensable tool when developing new combustion concepts While pure thermodynamic models are well established tools that are in use for the simulation of the transient behavior of complex systems for a long time the phenomenological models have become more important in the recent years and have also been implemented in these simulation programs In contrast to this the three dimensional simulation of in cylinder combustion i e the detailed integrated and continuous simulation of the process chain injection mixture formation ignition heat release due to combustion and formation of pollutants has been significantly improved but there is still a number of challenging problems to solve regarding for example the exact description of processes like the structure of turbulence during combustion as well as the appropriate choice of the numerical grid While chapter 2 includes a short introduction of functionality and operating modes of internal combustion engines the basics of kinetic reactions are presented in chapter 3 In chapter 4 the physical and chemical processes taking place in the combustion chamber are described Chapter 5 is about phenomenological multi zone models and in chapter 6 the formation of pollutants is described

Modeling Engine Spray and Combustion Processes Gunnar Stiesch, 2013-06-29 The utilization of mathematical models to numerically describe the performance of internal combustion engines is of great significance in the development of new and improved engines Today such simulation models can already be viewed as standard tools and their importance is likely to increase further as available computer power is expected to increase and the predictive quality of the models is constantly enhanced This book describes and discusses the most widely used mathematical models for in cylinder spray and combustion processes which are the most important subprocesses affecting engine fuel consumption and pollutant emissions The relevant thermodynamic fluid dynamic and chemical principles are summarized and then the application of these principles to the in cylinder processes is explained Different modeling approaches for the each subprocesses are compared and discussed with respect to the governing model assumptions and simplifications Conclusions are drawn as to which model approach is appropriate for a specific type of problem in the development process of an engine Hence this book may serve both as a graduate level textbook for combustion engineering students and as a reference for professionals employed in the field of combustion engine modeling The research necessary for this book was carried out during my employment as a postdoctoral scientist at the Institute of Technical Combustion ITV at the University of Hannover Germany and at the Engine Research Center ERC at the University of Wisconsin Madison USA

*Combustion Engines Development* Günter P. Merker, Christian Schwarz, Rüdiger Teichmann, 2011-09-24 Combustion Engines Development nowadays is based on

simulation not only of the transient reaction of vehicles or of the complete driveshaft but also of the highly unsteady processes in the carburation process and the combustion chamber of an engine. Different physical and chemical approaches are described to show the potentials and limits of the models used for simulation.

**Mixture Formation in Internal Combustion Engines** Carsten Baumgarten, 2006-09-28 A systematic control of mixture formation with modern high pressure injection systems enables us to achieve considerable improvements of the combustion process in terms of reduced fuel consumption and engine out raw emissions. However, because of the growing number of free parameters due to more flexible injection systems, variable valve trains, the application of different combustion concepts within different regions of the engine map, etc., the prediction of spray and mixture formation becomes increasingly complex. For this reason, the optimization of the in-cylinder processes using 3D computational fluid dynamics (CFD) becomes increasingly important. In these CFD codes, the detailed modeling of spray and mixture formation is a prerequisite for the correct calculation of the subsequent processes like ignition, combustion, and formation of emissions. Although such simulation tools can be viewed as standard tools today, the predictive quality of the sub-models is constantly enhanced by a more accurate and detailed modeling of the relevant processes and by the inclusion of new important mechanisms and effects that come along with the development of new injection systems and have not been considered so far. In this book, the most widely used mathematical models for the simulation of spray and mixture formation in 3D CFD calculations are described and discussed. In order to give the reader an introduction into the complex processes, the book starts with a description of the fundamental mechanisms and categories of fuel injection, spray break-up, and mixture formation in internal combustion engines.

**Analysis of Injection Processes in an Innovative 3D-CFD Tool for the Simulation of Internal Combustion Engines** Marlene Wentsch, 2018-05-16 Due to the large number of influencing parameters and interactions, the fuel injection and therewith fuel propagation and distribution are among the most complex processes in an internal combustion engine. For this reason, injection is usually the subject to highly detailed numerical modeling, which leads to unacceptably high computing times in the 3D CFD simulation of a full engine domain. Marlene Wentsch presents a critical analysis, optimization, and extension of injection modeling in an innovative, fast response 3D CFD tool that is exclusively dedicated to the virtual development of internal combustion engines. About the Author: Marlene Wentsch works as research associate in the field of 3D CFD simulations of injection processes at the Institute of Internal Combustion Engines and Automotive Engineering (IVK) University of Stuttgart, Germany.

**IC Engine CH4/H2 Air Combustion Simulation** Eileen A. Mouradian, 1992 *An Innovative 3D-CFD-Approach towards Virtual Development of Internal Combustion Engines* Marco Chiodi, 2011-03-07 In the engine development process, simulation and predictive programs have continuously gained in reliance. Due to the complexity of future internal combustion engines, the application of simulation programs towards a reliable virtual engine development is a need that represents one of the greatest challenges. Marco Chiodi presents an innovative 3D CFD tool, exclusively dedicated and optimized for the simulation of internal

combustion engines Thanks to improved or newly developed 3D CFD models for the description of engine processes this tool ensures an efficient and reliable calculation also by using coarse 3D CFD meshes Based on this approach the CPU time can be reduced up to a factor 100 in comparison to traditional 3D CFD simulations In addition an integrated and automatic evaluation tool establishes a comprehensive analysis of the relevant engine parameters Due to the capability of a reliable virtual development of full engines this fast response 3D CFD tool makes a major contribution to the engine development process S dwestmetall F rderpreis 2010 *Cfd Simulation of Internal Combustion Engines* Abhijeet Vaidya,2010-07

Understanding highly complex nature of flow in an IC engine is essential to optimize its performance However the events like reciprocating motion of piston motion of valves turbulence generation spray and mixing lead to a complex flow pattern CFD is very useful in computing and understanding this complex flow pattern In this book all aspects of CFD technique to simulate the mixing of fuel with air in GDI engines are explained The book covers the governing equations numerical techniques for solving them method of analysis of data in the context of mixing processes and programming techniques The book will be useful for professionals who are performing CFD analysis using CFD softwares for thermal systems specifically reciprocating systems like engines compressors and systems involving sprays mixing etc It is also useful for those who are developing CFD tools

**Computational Optimization of Internal Combustion Engines** Yu Shi,Hai-Wen Ge,Rolf D. Reitz,2011-06-22 Computational Optimization of Internal Combustion Engines presents the state of the art of computational models and optimization methods for internal combustion engine development using multi dimensional computational fluid dynamics CFD tools and genetic algorithms Strategies to reduce computational cost and mesh dependency are discussed as

well as regression analysis methods Several case studies are presented in a section devoted to applications including assessments of spark ignition engines dual fuel engines heavy duty and light duty diesel engines Through regression analysis optimization results are used to explain complex interactions between engine design parameters such as nozzle design injection timing swirl exhaust gas recirculation bore size and piston bowl shape Computational Optimization of Internal Combustion Engines demonstrates that the current multi dimensional CFD tools are mature enough for practical development of internal combustion engines It is written for researchers and designers in mechanical engineering and the automotive industry

Ganesan, This book attempts to provide a simplified framework for the vast and complex map of technical material that exists on compression ignition engines and at the same time include sufficient details to convey the complexity of engine simulation The emphasis here is on the thermodynamics combustion physics and chemistry heat transfer and friction processes relevant to compression ignition engines with simplifying assumptions

Massively Parallel Large-Eddy Simulation Solver for Internal Combustion Engines Sven Berger,2021

**Detailed Modeling of SI Engines in Fuel Consumption Simulations for Functional Analysis** Manuel Dorsch,2016 The aim of this thesis is to establish a coupled modeling approach to simulate fuel consumption and in cylinder gas emissions of a passenger car in various driving cycles NEDC RDE WLTP Combining models of the engine control unit and the mechanical vehicle powertrain with a crank angle based combustion engine simulation opens up the possibility to support the development and calibration of future engines demonstrated here for a turbo charged spark ignited engine with direct injection and a fully variable valvetrain Thermodynamic processes are implemented within a 1D gas exchange model which allows to consider not only steady state but also transient engine operation The coupled system is extended by calculations of engine out emissions considering the formation of nitrogen oxide NOx carbon monoxide CO and hydrocarbons HC Furthermore tailpipe emissions are determined in an additional simulation model The successful validation of this complex coupling technique is presented with exemplary results from all stages of the validation process Finally the advantage of this simulation methodology is shown by several application examples demonstrating the attained capabilities
