Geotechnical Earthquake Engineering Paula Kramer, 1996-01 Monotonic and Cyclic Performance of Sand from Natural Alluvial Deposits Julijana Bojadjeva, 2024-11-25 This book presents a comprehensive experimental investigation consisting of element scale triaxial and simple shear tests and model scale shaking table tests to examine the monotonic and cyclic behavior of Skopje sand Skopje sand is silica sand from natural alluvial river deposits collected from the river terraces of Vardar river in the city of Skopje Macedonia Numerical simulation of the element monotonic and cyclic tests is also presented using the hypoplastic material model Particular focus is given on the liquefaction potential of the tested material While there were no well documented cases of liquefaction during the 1963 Skopje earthquake with a magnitude of 6.1 significant structural damage was attributed to pronounced site amplification effects of sand materials in the Vardar valley Given the absence of

seismic geotechnical codes in the region at that time the lack of a seismic monitoring network and limited knowledge about the city's geotechnical properties there is the assumption that liquefaction might have occurred but went undocumented and unassessed due to the overwhelming structural damage and other post earthquake disaster management activities The generated experimental data of Skopje sand serve as a foundational dataset for students and researchers into continuous more advanced experimental research in the field validating numerical modeling focusing on liquefaction phenomena soil dynamics induced settlement of buildings and evaluating effective mitigation strategies The conducted investigations provide a strong basis for sustainable research on element and model scale in the Laboratory for Soil Dynamics and Geotechnical Engineering at the Department of Geotechnics and Special Structures Institute of Earthquake Engineering and Engineering Seismology IZIIS Skopje Macedonia

**Achieve Complex Seismic Performance Objectives** Troy Alexander Morgan, 2007 *Displacement-based Seismic Design of Structures* M. J. N. Priestley, Gian Michele Calvi, Mervyn J. Kowalsky, 2007 *Displacement Based Seismic Design of Structures* is a book primarily directed towards practicing structural designers who are interested in applying performance based concepts to seismic design. Since much of the material presented in the book has not been published elsewhere it will also be of considerable interest to researchers and to graduate and upper level undergraduate students of earthquake engineering who wish to develop a deeper understanding of how design can be used to control seismic response. The design philosophy is based on determination of the optimum structural strength to achieve a given performance limit state related to a defined level of damage under a specified level of seismic intensity. Emphasis is also placed on how this strength is distributed through the structure. This takes two forms: methods of structural analysis and capacity design. It is shown that equilibrium considerations frequently lead to a more advantageous distribution of strength than that resulting from stiffness considerations. Capacity design considerations have been re-examined and new and more realistic design approaches are presented to insure against undesirable modes of inelastic deformation. The book considers a wide range of structural types including separate chapters on frame buildings, wall buildings, dual wall frame buildings, masonry buildings, timber structures, bridges, structures with isolation or added damping devices, and wharves. These are preceded by introductory chapters discussing conceptual problems with current force based design, seismic input for displacement based design, fundamentals of direct displacement based design, and analytical tools appropriate for displacement based design. The final two chapters adapt the principles of displacement based seismic design to assessment of existing structures and present the previously developed design information in the form of a draft building code. The text is illustrated by copious worked design examples (39 in all) and analysis aids are provided in the form of a CD containing three computer programs covering moment curvature analysis, CUBIA (linear element based inelastic time history analysis), RUAUMOKO (a general fibre element dynamic analysis program), and SeismoStruct. The design procedure developed in this book is based on a secant stiffness rather than initial stiffness representation of structural response using a level of damping equivalent to the combined effects of elastic and hysteretic damping. The approach has been fully verified by extensive inelastic time history analyses which are extensively reported in the text. The design method is extremely simple to apply and very successful in providing dependable and predictable seismic response. Authors: Bios M J N Priestley.
