Laboratory Experiments in General Physics, 1985 ,1988 A Baseband, Impulse Ultra-wideband Transceiver Front-end for Low Power Applications Ian David O'Donnell,2006 Interest in indoor wireless communications has been increasing In addition to

high throughput WLAN systems such as 802.11a/b/g/n attention is also being focused on lower rate short distance systems such as Bluetooth and Zigbee. These low rate radios are being proposed for a variety of applications including automation, security, smart toys, remote sensing, control, asset tracking, and as a replacement for computer peripheral wires. While not demanding aggressive throughput, these radios do require low cost, power efficient operation, and optionally the ability to perform ranging. Unfortunately, currently reported radios are up to an order of magnitude away from these power and cost targets or do not support ranging. However, a recent ruling from the FCC has opened up nearly 8GHz of unlicensed spectrum from dc to 960MHz and from 3.1GHz to 10.6GHz for ultra wideband (UWB) deployment. One attractive method of UWB signaling that seems suited to a low power, highly integrated implementation communicates with short pulses on the order of a nanosecond that spread energy over at least 500MHz of bandwidth. Termed impulse UWB, the baseband nature of this signaling promises low cost and low power consumption through design simplicity, pulsed or duty cycled operation, and a mostly digital implementation. The benefits of this approach are balanced by the risk of jamming from in-band interference of stricter sampling and gain constraints, and of increased digital complexity. This dissertation presents the system exploration, specification, design, and demonstration of a low power, highly integrated, flexible baseband impulse ultra wideband transceiver front end.

Mechanics, Heat, and the Human Body Howard D. Goldick, 2001. This unique introduction to physics for readers who are particularly interested in the human body covers a limited number of distinct physics topics related to mechanics and heat in great depth and with many examples and problems that relate directly to readers' interests. Each topic is developed quantitatively using high school level algebra, linear equations, simultaneous equations, trigonometric functions, and vectors. Applications focus on typical situations, e.g., the need for and proper use of a cane, the need for heat transfer from the body to the environment during exercise, and the relative contributions of the various mechanisms: convection, radiation, evaporation of sweat, the relation between energy ingested as food and energy expended during exercise, etc.
