for ObjectQuery's LINQ to Entities queries and parameterizing ObjectQuery's Updating Entities and Complex Types shows you how to perform create update and delete CUD operations on EntitySets and manage optimistic concurrency conflicts It starts with a detailed description of theObjectContext ObjectStateManager and its child objects which perform object identification and change tracking operations with EntityKeys This also covers validation of create and update operations optimizing the DataContext lifetime performing updates with stored procedures and working with complex types Binding Data Controls to theObjectContext describes creating design time data sources from ObjectContext EntitySet instances drag and drop addition of BindingNavigator BindingSource bound TextBox and DataGridView controls to Windows forms You also learn how to update EntityReference and EntitySet values with ComboBox columns in DataGridView controls You can't update EntitySet values directly you must delete and add a new member having the required value This concludes with a demonstration of the use of the ASP.NET EntityDataSource control bound to GridView and DropDownList controls Using the Entity Framework As a Data Source concentrates on using EF as a data source for the ADO.NET Data Services Framework the former codename Project Astoria remains in common use which is the preferred method for deploying EF v1 as a Web service provider EF v2 is expected to be able to support n tier data access with Windows Communication Foundation WCF directly A Windows form example uses Astoria's .NET 3.5 Client Library to display and update entity instances with the Atom Publication AtomPub or APP wire format The Web form project uses the AJAX Client Library and JavaScript Object Notation JSON as the wire format
