Sheibani, 2003 A 40 m high steel transmission tower having different bracing layout including cable bracing has been selected and analyzed using STAAD Pro Software in this study The structure behavior has been investigated in terms of natural frequency and internal forces distribution due to selfweight and lateral load The optima weight deflections profiles and values of C T ratio have been used to compare the response of different frames The obtained results indicates that the case number 2 with single diagonal bracing gives the average weight of section logical natural frequency and displacement in comparison with other cases This case has been considered to be the tenability of axial forces shear forces and bending

moment The cable bracing is very unequivocal to resist the displacement and lateral forces and it has a very great effect on the structure Among all the cases case number 10 has a medial weight and the smaller values of internal force if it is compared with the other cable cases
