Torsional-vibration Analysis Via Network Theory John Ogilvy Flower,2016

Sensitivity Analysis of Torsional Vibration Characteristics of Helicopter Rotor Blades. Part 1: Structural Dynamics Analysis ,1974 A theoretical investigation of structural vibration characteristics of rotor blades was carried out Coupled equations of motion for flapwise bending and torsion were formulated for rotor blades with noncollinear elastic and mass axes The finite element method was applied for a detailed representation of blade structural properties Coupled structural mass and stiffness coefficients were evaluated The range of validity of a set of coupled equations of motion linearized with respect to eccentricity between elastic and mass axes was investigated The sensitivity of blade vibration characteristics to torsion were evaluated by varying blade geometric properties boundary conditions and eccentricities between mass and elastic axes

Sensitivity Analysis of Torsional Vibration Characteristics of Helicopter Rotor Blades. Part 2: Aerodynamics and Sensitivity Analysis ,1974 A theoretical investigation of dynamic response characteristics of rotor blades was carried out with special emphasis on torsional degrees of freedom Coupled equations of motion for flapwise bending and torsion were formulated at varying azimuth positions for rotor blades with noncollinear aerodynamic elastic and mass axes Both structural and aerodynamic mass damping and stiffness coefficients were included The variations of a sample blade at different flight conditions were investigated from these equations The obtained numerical results were illustrated The sensitivity of overall blade vibration characteristics to torsional oscillations was also investigated from the equations of motion for the sample blade The illustrated results show the importance of torsional degrees of freedom in rotor blade analysis Various possibilities of improving the overall response by tuning blade geometric structural and aerodynamic characteristics are discussed

ASME 67-VIBR-3 D. A. Klokkenga,American Society of Mechanical Engineers,1967 *Case Histories in Vibration Analysis and Metal Fatigue for the Practicing Engineer* Anthony Sofronas,2012-07-25 This highly accessible book provides analytical methods and guidelines for solving vibration problems in industrial plants and demonstrates their practical use through case histories from the author s personal experience in the mechanical engineering industry It takes a simple analytical approach to the subject placing emphasis on practical applicability over theory and covers both fixed and rotating equipment as well as pressure vessels It is an ideal guide for readers with diverse experience ranging from undergraduate students to mechanics and professional engineers

Torsional Vibration Analysis ,1971 *Vibration Analysis of Gas Turbine Rotors* Srinivasa Rao Dokku,2018-09-20 Master s Thesis from the year 2016 in the subject Engineering Mechanical Engineering language English abstract The purpose of this report is to determine the lateral and torsional dynamic characteristics of the complete system under synchronous conditions of excitation and response A damped natural response study was made in order to investigate the combined effect of oil film stiffness and damping coefficients on system damping and stability characteristics at all damped natural resonance speeds An unbalance response analysis is also performed to

study the system sensitivity This study was performed to investigate the lateral vibration characteristics of the subject system in order to avoid vibration problems that might interfere with the smooth and reliable operation of the system Total system studies are important in that often the coupling effects of marrying driver and driven equipment result in resonant speeds that are not calculable when investigating the response of the separate components Oil film stiffness and damping for all bearings must be properly considered in the system calculations along with the effective stiffness and damping of pedestal supports as required The above effects are in the following calculation to ensure the proper calculation of resonant speeds The following study concerns itself with the lateral analysis of gas turbine load coupling and 50 Hz 15 75Kva generator This study reports the lateral natural frequencies and mode shapes calculated from the mass and stiffness distribution of the beam elements modeled using the DYROBES software An unbalanced response analysis is also performed to study the system sensitivity The significance of torsional vibration in high speed rotating machinery is well established It is desirable to keep all torsional natural frequencies away from operating speed as well as twice the electrical frequency of the system However this is not always feasible and therefore torsional criticals can be tolerated within these regions provided the response to excitation levels are low enough to keep the alternating shear stress within acceptable levels The following study concerns itself with the complete torsional analysis of gas turbine rotor including load coupling gear box and 50Hz 15 75KVA generator rotor This study reports the torsional natural frequencies mode shapes and Campbell diagram by using transfer matrix method The transient response shear stresses were also calculated for fault condition

Vibration of Structures and Machines Giancarlo Genta,1999 This book addresses important aspects of nonlinear vibration analysis presenting cases of interest to researchers and engineers Developing the subject from its foundations the book takes readers through vibrations in linear systems and then into nonlinear vibrations including a treatment of chaotic vibrations

Noise and Torsional Vibration Analysis of Hybrid Vehicles Xiaolin Tang,Yanjun Huang,Hong Wang,Yechen Qin,2018-12-27

Thanks to the potential of reducing fuel consumption and emissions hybrid electric vehicles HEVs have been attracting more and more attention from car manufacturers and researchers Due to involving two energy sources i e engine and battery the powertrain in HEVs is a complicated electromechanical coupling system that generates noise and vibration different from that of a traditional vehicle Accordingly it is very important to explore the noise and vibration characteristics of HEVs In this book a hybrid vehicle with two motors is taken as an example consisting of a compound planetary gear set CPGS as the power split device to analyze the noise and vibration characteristics It is specifically intended for graduates and anyone with an interest in the electrification of full hybrid vehicles The book begins with the research background and significance of the HEV The second chapter presents the structural description and working principal of the target hybrid vehicle Chapter 3 highlights the noise vibration and harshness NVH tests and corresponding analysis of the hybrid powertrain Chapter 4

provides transmission system parameters and meshing stiffness calculation Chapter 5 discusses the mathematical modeling and analyzes torsional vibration TV of HEVs Finally modeling of the hybrid powertrain with ADAMS is given in Chapter 6
