

I tre problemi di costruzione con riga e compasso, per la cui soluzione lo sforzo dei geometri portò comunque ad altri importanti risultati matematici, sono in realtà estensione di problemi già risolti dai Greci; essere in grado di bisecare l'angolo poteva porre il problema della tripartizione, così come l'essere in grado di ricavare il quadrato di area doppia di quella di un quadrato dato poteva portare all'analogo problema per il cubo; la quadratura del cerchio poi, che affianca e segue il problema della rettificazione della circonferenza, appartiene alla tipologia del problema greco che consiste nella costruzione di una figura di forma data, avente area uguale a quella di un'altra data figura; in particolare la **duplicazione del cubo** fa parte di quei problemi che cercano di estendere alle figure solide i risultati ottenuti per le figure piane.

Il problema della **duplicazione del cubo** consiste nel determinare il lato di un cubo il cui volume è doppio di quello di un dato cubo. Sia a la misura del lato del cubo dato e x quella del lato del cubo di volume doppio. Si ha $x^3 = 2a^3$, cioè $x^3 - 2a^3 = 0$.

Si tratta di un problema algebrico di terzo grado. L'equazione ottenuta è irriducibile e il problema non è risolubile per via elementare.

Diocle di Caristo, matematico e fisico greco, nato intorno al 240 a.C. e morto verso il 180 a.C., scrisse un trattato **Περί πυρρίων** (*Sugli specchi ustori*), del quale ci sono giunti due brani attraverso la traduzione araba e anche attraverso due riassunti mediante **Eutocio**, nel suo commento all'opera di Archimede "Sulla sfera e il cilindro". In uno di questi frammenti è trattata la soluzione del problema della duplicazione del cubo che, all'epoca, insieme alla quadratura del cerchio e alla trisezione dell'angolo, formavano i cosiddetti Problemi di Delo. La sua soluzione, originale, procede per individuazione di due medi proporzionali, ricorrendo ad una curva, oggi nota come **Cissoide di Diocle**.

Questo problema è collegato a quello analogo, trattato già nel V sec. a.C. da **Ippocrate di Chio**, per riduzione del problema stesso a quello di trovare due medi proporzionali a due segmenti dati, il maggiore dei quali è doppio del minore.
