4th Sem Structural Analysis 1:

Structural Analysis-I, 4th Edition Bhavikatti S.S., Structural Analysis or the Theory of Structures is an important subject for civil engineering students who are required to analyze and design structures. It is a vast field and is largely taught at the undergraduate level. A few topics like Matrix Method and Plastic Analysis are also taught at the postgraduate level and in structural engineering electives. The entire course has been covered in two volumes: Structural Analysis I and II. Structural Analysis I deals with the basics of structural analysis, measurements of deflection, various types of deflection loads, and influence lines, etc. Dilute Magnetic Semiconducting (DMS) Materials R. Saravanan, 2018-08-25. Diluted Magnetic Semiconductors (DMS) play a vital role in the modern electronics industry. It is important to understand the fundamental properties of these materials in order to apply them to their full potential. This book presents an analysis of the charge density distribution and other properties of some silicon and germanium-based diluted magnetic semiconductors. A quantitative analysis of the charge density distribution has been done in order to obtain measurements of the charges involved in the bonding, which are decisive for the physical and chemical properties of the DMS materials. Also, the local structures of the materials have been analyzed by studying their powder X-ray diffraction intensities. Analysis of the magnetic properties of the DMS materials is mandatory and has been accomplished by magnetic measurements carried out using a vibrating sample magnetometer. The morphology of the DMS materials has been studied using scanning electron micrographs.

Engineering Second Edition Four Volume Set is an interdisciplinary and innovative reference work on membrane science and technology. Written by leading researchers and industry professionals from a range of backgrounds, chapters elaborate on recent and future developments in the field of membrane science and explore how the field has advanced since the previous edition published in 2010. Chapters are written by academics and practitioners across a variety of fields including chemistry, chemical engineering, material science, physics, biology, and food science. Each volume covers a wide spectrum of applications and advanced technologies such as new membrane materials (e.g. thermally rearranged polymers, polymers of intrinsic microporosity) and new hydrophobic fluoropolymer and processes (e.g. reverse electrodialysis, membrane contractors, membrane crystallization, membrane condenser, membrane dryers, and membrane emulsifiers) that have only recently proved their full potential for industrial application. This work covers the latest advances in membrane science, linking fundamental research with real-life practical applications using specially selected case studies of medium and large-scale membrane operations to demonstrate successes and failures with a look to future developments in the field. Contains comprehensive, cutting-edge coverage helping readers understand the latest theory. Offers readers a variety of perspectives on how membrane science and engineering research can be best applied in practice across a range of industries. Provides the theory behind the limits, advantages, future developments, and failure expectations of local membrane operations in emerging countries.
