Quantum Computing From The Ground Up:

Quantum Computing From The Ground Up Riley Tipton Perry, 2012-07-11 Quantum computing the application of quantum mechanics to information represents a fundamental break from classical information and promises to dramatically increase a computer's power Many difficult problems such as the factorization of large numbers have so far resisted attack by classical computers yet are easily solved with quantum computers If they become feasible quantum computers will end standard practices such as RSA encryption Most of the books or papers on quantum computing require or assume prior knowledge of certain areas such as linear algebra or quantum mechanics The majority of the currently available literature is hard to understand for the average computer enthusiast or interested layman This text attempts to teach quantum computing from the ground up in an easily readable way providing a comprehensive tutorial that includes all the necessary mathematics computer science and physics

COMPUTATIONAL DESIGN AND AUTOMATION IN STRUCTURAL ENGINEERING: FROM ALGORITHMS TO ARTIFICIAL INTELLIGENCE Jay Dalal ,2025-12-18 Buildings bridges towers dams and other infrastructure systems that allow contemporary civilization to function have their scientific and technical basis in structural engineering which has been an integral part of the built environment for a long time Fundamental to the field is the idea of making sure buildings can withstand all kinds of loads and environmental factors for the whole time they are supposed to be standing Structural engineers have long used simplified analytical techniques and engineering judgment in addition to the basic concepts of mathematics materials science and mechanics Although these principles are still important structural engineers now think about evaluate and build structural systems quite differently due to the fast development of digital technology The advent of digital technology has brought about a sea change from manual rule based processes to fully integrated computation driven workflows which in turn have increased productivity accuracy and creativity Prior to the widespread use of computers structural analysis and design relied heavily on manual computations simplified assumptions and visual aids like charts and design codes Engineers used heuristics based on past experience approximations and closed form analytical solutions to forecast how structures would behave When dealing with large scale systems non linear material behavior dynamic stress or complicated geometries these approaches often imposed constraints despite their effectiveness for conventional structures Over time the limitations of conventional methods were made apparent by the rising need for sustainable infrastructure larger buildings longer span bridges and lightweight constructions
