An Introduction to Applicable Game Theory Robert Gibbons,1996 This paper offers an introduction to game theory for applied economists I try to give simple definitions and intuitive examples of the basic kinds of games and their solution concepts There are four kinds of games static or dynamic and complete or incomplete information Complete information means there is no private information The corresponding solution concepts are Nash equilibrium in static games of complete information backwards induction or subgame perfect Nash equilibrium in dynamic games of complete information Bayesian Nash equilibrium in static games with incomplete information and perfect Bayesian or sequential equilibrium in dynamic games with incomplete information The main theme of the paper is that these solution concepts are closely linked As we consider progressively richer games we progressively strengthen the solution concept to rule out implausible equilibria in the richer games that would survive if we applied solution concepts available for simpler games In each case the stronger solution concept differs from the weaker concept only for the richer games not for the simpler games
