## **Principles Of Geotechnical Engineering Das 8th Edition:**

**Preparatory Excavation Works in Mines (Volume II)** Prof. Dr. Bilal Semih Bozdemir, 2 Density The density of soil and rock materials is essential in understanding their load bearing capabilities Bulk density is defined as the mass of the soil or rock per unit volume which includes both the solid particles and the void spaces between them Specific gravity on the other hand is a measure of density relative to the density of water and reflects the inherent material properties The relationship between moisture content and density is particularly significant As water content increases the density of the material changes impacting its engineering behavior Saturated soils will exhibit different properties compared to dry soils highlighting the importance of considering environmental conditions in classification 3 Moisture Content Moisture content is the amount of water contained in the soil or rock expressed as a percentage of the dry mass It is a critical factor influencing the behavior of both soils and rocks In soils moisture affects weight cohesion and plasticity The Atterberg limits critical for classifying fine grained soils define the boundaries of moisture content for various states liquid plastic and shrinkage In rocks moisture plays a vital role in weathering processes and can impact the rock s strength and durability Saturated conditions may lead to changes in pore pressure potentially causing instability especially in cases where excavation or grading is being performed

**Effective Shoulder Design and Maintenance** ,2007 Granular shoulders are an important element of the transportation system and are constantly subjected to performance problems due to wind and water induced erosion rutting edge drop off and slope irregularities Such problems can directly affect drivers safety and often require regular maintenance The present research study was undertaken to investigate the factors contributing to these performance problems and to propose new ideas to design and maintain granular shoulders while keeping ownership costs low This report includes observations made during a field reconnaissance study findings from an effort to stabilize the granular and subgrade layer at six shoulder test sections and the results of a laboratory box study where a shoulder section overlying a soft foundation layer was simulated Based on the research described in this report the following changes are proposed to the construction and maintenance methods for granular shoulders A minimum CBR value for the granular and subgrade layer should be selected to alleviate edge drop off and rutting formation For those constructing new shoulder sections the design charts provided in this report can also be used to predict the behavior of existing shoulders In the case of existing shoulder sections overlying soft foundations the use of geogrid or fly ash stabilization proved to be an effective technique for mitigating shoulder rutting
