HUMAN COMPUTER INTERACTION

UNIT-I

INTRODUCTION

Human-computer interaction (HCI), alternatively man-machine interaction (MMI) or computer-human interaction (CHI) is the study of interaction between people (users) and computers.

- With today's technology and tools, and our motivation to create really effective and usable interfaces and screens, why do we continue to produce systems that are inefficient and confusing or, at worst, just plain unusable? Is it because:
 1. We don't care?
 2. We don't possess common sense?
 3. We don't have the time?
 4. We still don't know what really makes good design?

DEFINITION

- "Human-computer interaction is a discipline concerned with the design, evaluation and implementation of interactive computing systems for human use and with the study of major phenomena surrounding them."

GOALS

- A basic goal of HCI is
 - to improve the interactions between users and computers
 - by making computers more usable and receptive to the user's needs.
- A long term goal of HCI is
 - to design systems that minimize the barrier between the human's cognitive model of what they want
 - to accomplish and the computer's understanding of the user's task

WHY IS HCI IMPORTANT

- User-centered design is getting a crucial role!
- It is getting more important today to increase competitiveness via HCI studies (Norman, 1990)

Human-Computer Interaction - INTERACT '87 Hans-Jörg Bullinger, B. Shackel, Klaus Kornwachs, 1987-11. Since the first INTERACT Conference in September 1984, the field of Human Computer Interaction has received increasing attention from researchers and industrial practitioners; the importance of the topic now being widely recognized. Technological developments have made it possible to seek new solutions to the problem of supporting work processes by information technology and for designing the interface between user and the machine. Computers have become an everyday and common tool in the work of many people. This has motivated the development of an interdisciplinary field of research which now appears much more established than it was a few years ago. The INTERACT forums provide the opportunity for regular presentation and discussion of new results from research and application by bringing together the various disciplines and research approaches on a worldwide basis.

Human-computer Interaction--INTERACT '90 Dan Diaper, 1990

The past decade has seen the growth and diffusion of information technology exceeding most predictions, even those of many optimistic researchers. At the same time, there has also been a substantial increase in concern for the human aspects of computing and information technology systems. Brought together in this book are 150 papers presenting, discussing, and surveying recent research into Human Computer Interaction. Included are a number of case studies describing a wide range of applications and projects.

Man-computer Interaction Research Friedhart Klix, 1989. Since MACINTER I appeared two years ago, research into human computer interaction has been advancing at an undiminished rate all over the world. The papers in this book deal with the psychological aspects of human computer interaction and present the results of basic and applied psychological research. The basic research areas are cognitive issues in human computer interaction: user's mental models, user's strategies, knowledge representation and elicitation, and learning and user training. The application of findings in psychology-based system design is also discussed. Emphasis is placed on both interdisciplinary cooperation between psychology and computer science, as well as intradisciplinary cooperation between different fields of psychology, e.g. cognitive and industrial psychology. A general overview on the state of the art in quite different groups in East and West Europe and Japan is presented. Empirical data, as well as theoretical and methodological approaches for the practical design of human computer interaction, are summarized in this book.
