Comprehensive Nuclear Materials, 2020-07-22 Materials in a nuclear environment are exposed to extreme conditions of
radiation temperature and or corrosion and in many cases the combination of these makes the material behavior very
different from conventional materials This is evident for the four major technological challenges the nuclear technology
domain is facing currently i long term operation of existing Generation II nuclear power plants ii the design of the next
generation reactors Generation IV iii the construction of the ITER fusion reactor in Cadarache France iv and the intermediate
and final disposal of nuclear waste In order to address these challenges engineers and designers need to know the properties
of a wide variety of materials under these conditions and to understand the underlying processes affecting changes in their
behavior in order to assess their performance and to determine the limits of operation *Comprehensive Nuclear Materials*
Second Edition Seven Volume Set provides broad ranging validated summaries of all the major topics in the field of nuclear
material research for fission as well as fusion reactor systems Attention is given to the fundamental scientific aspects of
nuclear materials fuel and structural materials for fission reactors waste materials and materials for fusion reactors The
articles are written at a level that allows undergraduate students to understand the material while providing active
researchers with a ready reference resource of information Most of the chapters from the first Edition have been revised and
updated and a significant number of new topics are covered in completely new material During the ten years between the
two editions the challenge for applications of nuclear materials has been significantly impacted by world events public
awareness and technological innovation Materials play a key role as enablers of new technologies and we trust that this new
edition of *Comprehensive Nuclear Materials* has captured the key recent developments Critically reviews the major classes
and functions of materials supporting the selection assessment validation and engineering of materials in extreme nuclear
environments *Comprehensive* resource for up to date and authoritative information which is not always available elsewhere
even in journals Provides an in depth treatment of materials modeling and simulation with a specific focus on nuclear issues
Serves as an excellent entry point for students and researchers new to the field **Justifying Dictatorship** Alexander

Dukalskis, Johannes Gerschewski, 2018-12-07 How do dictatorships justify their rule and with what effects This and similar questions guide the contributions to this edited volume Despite the recent resurgence of political science scholarship on autocratic resilience many questions remain unanswered about the role of legitimation in contemporary non democracies and its relationship with neighbouring concepts like ideology censorship and consent The overarching thesis of this book is that autocratic legitimation has causal influence on numerous outcomes of interest in authoritarian politics These outcomes include regime resilience challenger state interactions the procedures and operations of elections social service provision and the texture of everyday life in autocracies Researchers of autocratic politics will benefit from the rich contributions of this volume The chapters in this book were originally published in a special issue of Contemporary Politics
