Hybrid Offline/Online Methods for Optimization Under Uncertainty Allegra De Filippo, 2022-04-15 Balancing the solution quality time trade off and optimizing problems which feature offline and online phases can deliver significant improvements in efficiency and budget control Offline online integration yields benefits by achieving high quality solutions while reducing online computation time This book considers multi stage optimization problems under uncertainty and proposes various methods that have broad applicability Due to the complexity of the task the most popular approaches depend on the temporal granularity of the decisions to be made and are in general sampling based methods and heuristics Long term strategic decisions that may have a major impact are typically solved using these more accurate but expensive sampling based approaches Short term operational decisions often need to be made over multiple steps within a short time frame and are commonly addressed via polynomial time heuristics with the more advanced sampling based methods only being applicable if their computational cost can be carefully managed Despite being strongly interconnected these 2 phases are typically solved in isolation In the first part of the book general methods based on a tighter integration between the two phases are proposed and their applicability explored and these may lead to significant improvements The second part of the book focuses on how to manage the cost quality trade off of online stochastic anticipatory algorithms taking advantage of some offline information All the methods proposed here provide multiple options to balance the quality time trade off in optimization problems that involve offline and online phases and are suitable for a variety of practical application scenarios

*Variational Methods in Partially Ordered Spaces* Alfred Göpfert, Hassan Riahi, Christiane Tammer, Constantin Zălinescu, 2023-12-08 In mathematical modeling of processes occurring in logistics management science operations research networks mathematical finance medicine and control theory one often encounters optimization problems involving more than one objective function so that Multiobjective Optimization or Vector Optimization initiated by W Pareto has received new impetus The growing interest in vector optimization problems both from the theoretical point of view and as it concerns applications to real world optimization problems asks for a general scheme which embraces several existing developments and stimulates new ones This book aims to provide the newest results and applications of this quickly growing field Basic tools of partially ordered spaces are discussed and applied to variational methods in nonlinear analysis and to optimization problems The book begins by providing simple examples that illustrate

what kind of problems can be handled with the methods presented The book then deals with connections between order structures and topological structures of sets discusses properties of nonlinear scalarization functions and derives corresponding separation theorems for not necessarily convex sets Furthermore characterizations of set relations via scalarization are presented Important topological properties of multifunctions and new results concerning the theory of vector optimization and equilibrium problems are presented in the book These results are applied to construct numerical algorithms especially proximal point algorithms and geometric algorithms based on duality assertions In the second edition new sections about set less relations optimality conditions in set optimization and the asymptotic behavior of multiobjective Pareto equilibrium problems have been incorporated Furthermore a new chapter regarding scalar optimization problems under uncertainty and robust counterpart problems employing approaches based on vector optimization set optimization and nonlinear scalarization was added Throughout the entire book there are examples used to illustrate the results and check the stated conditions This book will be of interest to graduate students and researchers in pure and applied mathematics economics and engineering A sound knowledge of linear algebra and introductory real analysis should provide readers with sufficient background for this book [Intelligent Microgrid Management and EV Control Under Uncertainties in Smart Grid](#)

Ran Wang, Ping Wang, Gaoxi Xiao, 2017-11-20 This book discusses the latest research on the intelligent control of two important components in smart grids namely microgrids MGs and electric vehicles EVs It focuses on developing theoretical frameworks and proposing corresponding algorithms to optimally schedule virtualized elements under different uncertainties so that the total cost of operating the microgrid or the EV charging system can be minimized and the systems maintain stabilized With random factors in the problem formulation and corresponding designed algorithms it provides insights into how to handle uncertainties and develop rational strategies in the operation of smart grid systems Written by leading experts it is a valuable resource for researchers scientists and engineers in the field of intelligent management of future power grids

*Modern Optimization Methods for Decision Making Under Risk and Uncertainty* Alexei A. Gaivoronski, Pavlo S. Knopov, Volodymyr A. Zaslavskyi, 2023-10-06 The book comprises original articles on topical issues of risk theory rational decision making statistical decisions and control of stochastic systems The articles are the outcome of a series international projects involving the leading scholars in the field of modern stochastic optimization and decision making The structure of stochastic optimization solvers is described The solvers in general implement stochastic quasi gradient methods for optimization and identification of complex nonlinear models These models constitute an important methodology for finding optimal decisions under risk and uncertainty While a large part of current approaches towards optimization under uncertainty stems from linear programming LP and often results in large LPs of special structure stochastic quasi gradient methods confront nonlinearities directly without need of linearization This makes them an appropriate tool for solving complex nonlinear problems concurrent optimization and simulation models and equilibrium situations of different types for

instance Nash or Stackelberg equilibrium situations The solver finds the equilibrium solution when the optimization model describes the system with several actors The solver is parallelizable performing several simulation threads in parallel It is capable of solving stochastic optimization problems finding stochastic Nash equilibria and of composite stochastic bilevel problems where each level may require the solution of stochastic optimization problem or finding Nash equilibrium Several complex examples with applications to water resources management energy markets pricing of services on social networks are provided In the case of power system regulator makes decision on the final expansion plan considering the strategic behavior of regulated companies and coordinating the interests of different economic entities Such a plan can be an equilibrium a planned decision where a company cannot increase its expected gain unilaterally
