

1. Overview of Automata Theory and Proof Methods

Automata theory studies abstract computing devices, or machines

- **Turing machines** were proposed by A. Turing in the 1930s as an abstraction for general-purpose computing machines
- **Finite automata**, which are simpler (less powerful) machines, were proposed in the 1940s and 1950s to model brain functions
- **Formal languages**, which are closely related the **pushdown automata machines**, were proposed by linguist N. Chomsky in the 1950s
- The study of time and space efficiency of programs led to models for **tractable** and **intractable** problems, e.g. NP-complete and NP-hard problems

Automata Studies John McCarthy, Claude Elwood Shannon, 1956 **Aristotle's Laptop** Igor Aleksander, Helen Morton, 2012 Aristotle's convincing philosophy is likely to have shaped even indirectly many of our current beliefs, prejudices and attitudes to life. This includes the way in which our mind that is our capacity to have private thoughts appears to elude a scientific description. This book is about a scientific ingredient that was not available to Aristotle: the science of information. Would the course of the philosophy of the mind have been different had Aristotle pronounced that the matter of mind was information? This OCO assertion is often heard in contemporary debates and this book explores the verities and falsehoods of this proposition.

WADC Technical Report United States. Wright Air Development Division, 1959 *Readings in Machine Learning* Jude W. Shavlik, Thomas Glen Dietterich, 1990 The ability to learn is a fundamental characteristic of intelligent behavior. Consequently machine learning has been a focus of artificial intelligence since the beginnings of AI in the 1950s. The 1980s saw tremendous growth in the field and this growth promises to continue with valuable contributions to science, engineering and business. *Readings in Machine Learning* collects the best of the published machine learning literature including papers that address a wide range of learning tasks and that introduce a variety of techniques for giving machines the ability to learn. The editors, in cooperation with a group of expert referees, have chosen important papers that empirically study, theoretically analyze or psychologically justify machine learning algorithms. The papers are grouped into a dozen categories, each of which is introduced by the editors.
