formulas constitutes a compendium of mathematics for economics and business. It contains the most important formulas, statements, and algorithms in this significant subfield of modern mathematics and addresses primarily students of economics or business at universities, colleges, and trade schools. But people dealing with practical or applied problems will also find this collection to be an efficient and easy-to-use work of reference. First, the book treats mathematical symbols and constants, sets, and statements, number systems, and their arithmetic, as well as fundamentals of combinatorics. The chapter on sequences and series is followed by mathematics of finance, the representation of functions of one and several independent variables, their differential and integral calculus, and by differential and difference equations. In each case, special emphasis is placed on applications and models in economics. The chapter on linear algebra deals with matrices, vectors, determinants, and systems of linear equations. This is followed by the representation of structures and algorithms of linear programming. Finally, the reader finds formulas on descriptive statistics, data analysis, ratios, inventory, and time series analysis, on probability theory, events, probabilities, random variables, and distributions, and on inductive statistics, point and interval estimates, tests. Some important tables complete the work.

Greenhouse Gases Ignacio Pérez Domínguez, 2006. The international community is putting some pressure on scientific researchers to come up with reliable indicators to estimate emissions from greenhouse gases. The development towards integrative multi-gas strategy approaches has allowed the inclusion of the agricultural sector in the political agenda. Modelling alternatives for the estimation of emission factors, definition of policy instruments for greenhouse gas emission abatement, as well as measurement of their economic effects, are at this stage quite important for the coming multilateral negotiations.
