Model Management and Analytics for Large Scale Systems Bedir Tekinerdogan,Önder Babur,Loek Cleophas,Mark van den Brand,Mehmet Aksit,2019-09-14 Model Management and Analytics for Large Scale Systems covers the use of models and related artefacts such as metamodels and model transformations as central elements for tackling the complexity of building systems and managing data With their increased use across diverse settings the complexity size multiplicity and variety of those artefacts has increased Originally developed for software

engineering these approaches can now be used to simplify the analytics of large scale models and automate complex data analysis processes Those in the field of data science will gain novel insights on the topic of model analytics that go beyond both model based development and data analytics This book is aimed at both researchers and practitioners who are interested in model based development and the analytics of large scale models ranging from big data management and analytics to enterprise domains The book could also be used in graduate courses on model development data analytics and data management Identifies key problems and offers solution approaches and tools that have been developed or are necessary for model management and analytics Explores basic theory and background current research topics related challenges and the research directions for model management and analytics Provides a complete overview of model management and analytics frameworks the different types of analytics descriptive diagnostics predictive and prescriptive the required modelling and method steps and important future directions MATLAB 5.0 for Engineers Joe King,1998 Consisting of modules that cover engineering skills and concepts programming languages and software tools this work is a flexible solution for keeping up with the curriculum of first year engineering American Book Publishing Record ,2000

Application of the Stochastic Optimization Method in Optimizing Traffic Signal Control Settings Byungkyu Park,2008 Traffic congestion has greatly affected not only the nation s economy and environment but also every citizen s quality of life A recent study shows that every American traveler spent an extra 38 hours and 26 gallons of fuel per year due to traffic congestion during the peak period Of this congestion 10% is attributable to improper operations of traffic signals Surprisingly more than a half of all signalized intersections in the United States needs to be re optimized immediately to maintain peak efficiency Even though many traffic signal control systems have been upgraded from pre timed controllers to actuated and adaptive controllers the traffic signal optimization software has not been kept current For example existing commercial traffic signal timing optimization programs including SYNCHRO and TRANSYT 7F do not optimize advanced controller settings available in the modern traffic controllers including minimum green time extension time and detector settings This is in part because existing programs are based on macroscopic simulation tools that do not explicitly consider individual vehicular movements To overcome such a shortcoming a stochastic optimization method SOM was proposed and successfully applied to a signalized corridor in Northern Virginia This study presents enhancements made in the SOM and case study results from an arterial network consisting of 16 signalized intersections The proposed method employs a distributed computing environment DCE for faster computation time and uses a shuffled frog leaping algorithm SFLA for better optimization The case study results showed that the proposed enhanced SOM method called SFLASOM improved the total network travel times over field settings by 3 5% for Mid Day and 2 1% for PM Peak In addition corridor travel times were improved by 2 3% to 17 9% over field settings However when the new SOM timing plan was compared to the new field timing plan implemented in July 2008 the improvements were marginal showing slightly over 2% reductions in individual
