Microwave Imaging and Electromagnetic Inverse Scattering Problems Andrea Morabito,2020-05-20 *Microwave*
imaging techniques allow for the development of systems that are able to inspect identify and characterize in a noninvasive
fashion under different scenarios ranging from biomedical to subsurface diagnostics as well as from surveillance and security
applications to nondestructive evaluation Such great opportunities though are actually severely limited by difficulties arising
from the solution of the underlying inverse scattering problem As a result ongoing research efforts in this area are devoted to
developing inversion strategies and experimental apparatus so that they are as reliable and accurate as possible with respect
to reconstruction capabilities and resolution performance respectively The intent of this Special Issue is to present the
experiences of leading scientists in the electromagnetic inverse scattering community as well as to serve as an assessment
tool for people who are new to the area of microwave imaging and electromagnetic inverse scattering problems

Microwave Imaging for Early Breast Cancer Detection Yoshihiko Kuwahara,2017 We overview the research trend on
microwave imaging for early breast cancer detection The technologies have two categories ultra wide band UWB radar that
reconstructs the scattering power distribution in the breast and inverse scattering problem that reconstructs the dielectric
properties distribution We have developed a clinical equipment using UWB radar and carried out clinical test 4 years ago
Through the experiments we concluded that the UWB radar was insufficient for the clinical equipment because the UWB
radar cannot discriminate cancerous tumor and other lesions Therefore we have been studying inverse scattering It is a
challenging task to develop an equipment using inverse scattering technologies We have proposed a microwave
mammography that has four features 1 sensor with breast fixing by absorption 2 small sensor with multipolarization 3 image
reconstruction program linking the commercial EM simulator and 4 hybrid imaging method using UWB radar and inverse

Inverse Scattering Analysis Applied to Breast Cancer Detection, 2009

This thesis presents a contribution to the development of the Forward Backward Time Stepping FBTS algorithm This technique is an approach to active microwave imaging applied to the breast cancer detection based on high contrast of electric properties between normal breast tissues and malignant tumor It is formulated in the time domain utilizing Finite Difference Time Domain FDTD method to reconstruct the microwave properties of the breast To demonstrate the validity of the FBTS technique both two dimensional 2 D and three dimensional 3 D cases were assessed via numerical simulations and experimental measurements The values of the nominal Debye parameters for the various tissues were applied In preliminary study the breast was assumed to be immersed in a lossless coupling liquid as a background medium Coupling liquid was chosen with a permittivity that roughly matches breast fat tissues Further research works utilizing the numerical breast model in a free space instead of coupling liquid were carried out to detect more than one tumor embedded in fibroglandular tissue of the breast The main purpose of using a free space as the background medium is for the microwave mammography equipment easier to be maintained than using coupling liquids
