

# EXPERIMENTAL DESIGN

Experimental design refers to the systematic approach and structure employed in conducting scientific experiments to investigate cause-and-effect relationships between variables.

## DEFINITION

Experimental design involves the careful manipulation of an independent variable while controlling and measuring other variables to assess their impact on the dependent variable. It is considered better than observational design when it comes to inferring cause-and-effect.

## TYPES

- **Quasi-experimental design** includes some control over variables but falls short of the random assignment of participants to conditions.
- **True experimental design** incorporates random assignment of participants to different conditions, allowing for stronger causal inferences to be made.

**Optimal Design of Experiments** Peter Goos,Bradley Jones,2011-06-28 This is an engaging and informative book on the modern practice of experimental design The authors writing style is entertaining the consulting dialogs are extremely enjoyable and the technical material is presented brilliantly but not overwhelmingly The book is a joy to read Everyone who practices or teaches DOE should read this book Douglas C Montgomery Regents Professor Department of Industrial Engineering Arizona State University It s been said Design for the experiment don t experiment for the design This book ably demonstrates this notion by showing how tailor made optimal designs can be effectively employed to meet a client s actual needs It should be required reading for anyone interested in

using the design of experiments in industrial settings Christopher J Nachtsheim Frank A Donaldson Chair in Operations Management Carlson School of Management University of Minnesota This book demonstrates the utility of the computer aided optimal design approach using real industrial examples These examples address questions such as the following How can I do screening inexpensively if I have dozens of factors to investigate What can I do if I have day to day variability and I can only perform 3 runs a day How can I do RSM cost effectively if I have categorical factors How can I design and analyze experiments when there is a factor that can only be changed a few times over the study How can I include both ingredients in a mixture and processing factors in the same study How can I design an experiment if there are many factor combinations that are impossible to run How can I make sure that a time trend due to warming up of equipment does not affect the conclusions from a study How can I take into account batch information in when designing experiments involving multiple batches How can I add runs to a botched experiment to resolve ambiguities While answering these questions the book also shows how to evaluate and compare designs This allows researchers to make sensible trade offs between the cost of experimentation and the amount of information they obtain
