

# Types of Transformations

## Big Picture

Transformations move and modify geometric shapes. There are several types of transformations that all transform figures in different ways. These transformations can be rigid (isometric) or non-rigid.

## Key Terms

**Transformation:** An operation that moves, flips, or changes a figure to create a new figure.

**Rigid:** A transformation that preserves size and shape.

**Isometry:** Another word for rigid transformation, a transformation that does not change the shape or size of a figure.

**Non-Rigid:** A transformation that does not preserve size

**Preimage:** The original figure before a transformation.

**Image:** The figure after a transformation.

**Vector:** A quantity that has direction and size

## Rigid Transformations

Specifically, **rigid transformations** (or congruence transformations) transform a figure without changing its size or shape.

The three types of rigid transformations are:

- **Reflection:** A transformation that turns a figure into its mirror image by flipping it over a line.
- **Rotation:** A transformation that turns a figure around a fixed point to create an image.
- **Translation:** A transformation that moves every point in a figure the same distance in the same direction.

To distinguish between the preimage and the image, primes are used to label the image. The arrow  $\rightarrow$  is used to describe a transformation.

- **Example:** If the preimage is  $A$ , then the image would be  $A'$ .  $A \rightarrow A'$

## Reflections

Another way to describe a reflection is a "flip."

- Image is the same distance away from the reflection line as the preimage.

### Reflections over the x-axis

Coordinates stay the same with a coordinate change.

- If  $(x, y)$  is reflected over the  $x$ -axis, then the image is  $(x, -y)$ .
- If  $(x, y)$  is reflected over  $y = -x$ , then the image is  $(-y, -x)$ .

### Reflections over the y-axis

Coordinates change with a coordinate stay constant.

- If  $(x, y)$  is reflected over the  $y$ -axis, then the image is  $(-x, y)$ .
- If  $(x, y)$  is reflected over  $y = -x$ , then the image is  $(y, -x)$ .

### Reflections over a vertical line

Any line can be a line of reflection, but the line  $x = a$  with  $a = 0$  are special cases.

- If  $(x, y)$  is reflected over the  $x = a$ , then the image is  $(2a - x, y)$ .
- If  $(x, y)$  is reflected over  $y = -x$ , then the image is  $(y, -x)$ .
