Emerging Non-destructive Technologies for Food Quality Analysis C. K. Sunil, Ashish Rawson, D. V. Chidanand, S. Shanmugasundaram, 2025-09-26 Non destructive quality analysis refers to a method of food testing that is designed explicitly to eliminate the potential of damage to the food quality There are various techniques by which this approach may be applied all of which are being used recently for quality analysis which provides important information on food characteristics such as texture structure and mechanical physical and chemical properties Conventional methods of quality analysis are time consuming expensive and invasive in nature particularly for long duration analysis Non destructive methods have thus become highly appealing for their potential to reduce cost and waste and to shorten processing times These approaches not only preserve the integrity of the product but also expedite the analysis process The most common non destructive methods used include machine vision Spectroscopy E nose tongue Ultrasonics and hyperspectral imaging among others While these methods have been in practice for some time the technological advancements of the last decade have improved the precision and reliability of these tools making them more popular An overview of the dominant non destructive methods including the more novel technologies such as biosensors and terahertz application have not until now been comprehensively covered in the form of a research volume *Emerging Non destructive Technologies for Food Quality Analysis* brings together detailed information on all these most current advances in technology and elucidates their application in food processing Covering theory principle recent advances and practical applications in food analysis this book will be an invaluable reference for students researchers food trainers and industry personnel

Nitrogen Use Efficiency: Plant Biology to Crop Improvement Nandula Raghuram, 2024-07-29 The predominant role of unused fertilizers in reactive nitrogen pollution and the need for research and policies to improve nitrogen use efficiency NUE is now well known globally NUE research was originally championed by the scientists of the International Nitrogen Initiative INI and later recognized by some national governments and UN agencies such as UNEP FAO and UNECE The resulting first ever UN resolution on Sustainable nitrogen management in 2019 boosted the demand for solutions especially in agriculture The Berlin Declaration from the INI 2021 conference called for improvement of nitrogen use efficiency towards achieving sustainable food systems and all the 17 sustainable development goals Crop NUE is primarily a biological problem as there

exists a genetic limit to agronomic improvement Overcoming this genetic barrier for crop improvement requires better understanding of the biological mechanisms of N response and the genetic determinants of NUE Fortunately crop genomics in general and the functional genomics of N response in particular have been providing a wealth of information The recent developments in phenotyping and genotyping for NUE and the emergence of phenomics coupled with the growing ability of bioinformatics to integrate diverse datasets offer unprecedented opportunities to solve the NUE puzzle Some candidate genes for this multi genic trait have been validated while some others are being identified shortlisted or offered for validation
