

Particles and Quantum

To absorb must be energy... $E_{photon} = h\nu$
 Annihilation - pair of particles and its corresponding antiparticle created and their rest energy is converted into photons

Pair production - when photon turns into a particle and its corresponding antiparticle. The photon must have at least the sum amount of energy which rest energies of particles

Excitation
 Existing more than just excited through energy to count their atoms

Alpha particles - Helium nucleus, ${}^4_2\text{He}$
 - highly ionizing, so it is dangerous
 - relatively penetrating - stopped by a piece of paper or foil on skin

Beta - fast moving electron $\rightarrow e^-$
 - medium penetrating and relatively ionizing - stopped by a few cm of aluminium
 - fast moving - $\frac{1}{2}c$ to $\frac{3}{4}c$ = $\frac{1}{2}mv^2 + mc^2$ = $E_{kinetic} + E_{rest}$

Gamma - high energy EM ray or photon emitted from a high energy nucleus $\rightarrow \gamma$
 - highly penetrating - stopped by a few m of concrete

Isotopes - same element - same number of protons
 - different relative atomic mass - different number of neutrons
 ${}^A_Z X$

Nuclear charge - $\frac{Q}{4\pi\epsilon_0} \left(\frac{1}{r^2}\right)$
 - charge to mass ratio

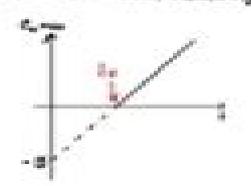

Electron volt - charge of an electron when accelerated through a pot of one volt
 - $1.6 \times 10^{-19} \text{ J}$
 - eV

Photoelectric effect

Use photons of sufficient energy or absorbed by electrons in the surface of a metal, liberating them

- 1. Photon absorbed - $E_{photon} = hf$
- 2. Frequency
- 3. Work function - minimum energy to liberate electrons
- 4. Kinetic energy left over after hf is subtracted
- 5. Stopped potential - minimum potential needed for electrons to be collected

The photoelectric effect proved the particle nature of light due to the fact that the continuous function between photon and electron $E_{photon} = hf$ or hf is more important than what they are. Contrary to the theory of light waves which would have E_{photon} as an electron liberated but it would be if hf is smaller than amount of electron that is emitted per second

Stopping potential - the pot. needed to stop any electrons from reaching the other side

- 1. $E_{photon} = hf$
- 2. Work function
- 3. Stopping potential

De Broglie

The de Broglie wavelength is the wavelength that a particle can have. The wave nature of a particle was proven by diffraction of a crystal from which produced similar grating that produces a diffraction pattern. This is because the electron is diffracting which is wave nature

$\lambda = \frac{h}{p} = \frac{h}{mv}$
 $\lambda = \text{de Broglie wavelength}$
 $p = \text{momentum / mass velocity}$

Fluorescent tubes

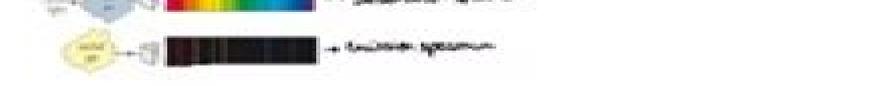

This tube works because under a high voltage is applied. This accelerates free electrons to which some of the moving electrons collide with particles in the gas causing them to give out energy in the form of light. When the free electrons collide with molecules in moving atoms, they are excited to higher energy levels when the electrons descend, they emit photons in the visible range. A phosphor coating in the tube absorbs the photons and emit visible light

Energy levels

Electrons can be excited to higher energy levels either by absorbing photons from the light or by the collision. In example below it is a free electron colliding with an electron in the ground state

Ionization energy - is enough energy to pull an electron out of an atom, so will completely remove the electron
