Clock Synchronization in Distributed Systems - a Comparison Harald Bachner, 2007-07-26 Bachelor Thesis from the year 2007 in the subject Computer Science Technical Computer Science grade 1 0 University of Applied Sciences Technikum Vienna Informations und Kommunikationssysteme 29 entries in the bibliography language English abstract Clock synchronization is a necessary and critical part in most distributed systems For many years NTP was the state of the art way of synchronizing computer clocks distributed in space However as recent advances in miniaturization lead to the construction of smaller more powerful and less power consuming computers embedded devices sensors and actuators the need for more precise time synchronization grew This work thus sets out to compare selected approaches to clock synchronization in distributed systems The well known Global Positioning System is disseminating accurate time and frequency information from the International Institutes that keep the time NTP can still do the same but at different levels of accuracy as well as cost Clock synchronization protocols like IEEE1588 or TTP and bus architectures like FlexRay evolved from the need to further propagate the timing information within small networks and therefore staying within the specified limits of preciseness

ACM Symposium on Access Control Models and Technologies*,2007 *Network and Distributed Systems Management* Morris Sloman,1994 A complete reference to network management from a bestselling editor and a world class team of contributors Complete and authoritative this book covers all aspects of networks from available technologies to selecting a vendor and maintaining the net Includes case studies and a survey of products Experiences with Distributed Systems Jürgen Nehmer,1988-05-25 This book contains papers presented at the NATO Advanced Research Workshop on Real time Object and Environment Measurement and Classification held in Maratea Italy August 31 September 3 1987 This workshop was organized within the activities of the NATO Special Programme on Sensory Systems for Robotic Control Four major themes were discussed at this workshop Real time Requirements Feature Measurement Object Representation and Recognition and Architecture for Measurement and Classification A total of twenty five technical presentations contained in this book cover a wide spectrum of topics including hardware implementation of specific vision algorithms a complete vision system for object tracking and inspection using three cameras trinocular stereo for feature measurement neural network for object recognition integration of CAD Computer Aided Design and vision systems and the use of pyramid architectures for solving various computer vision problems These papers are written by some of the very well known researchers in the computer vision and pattern recognition community and represent both industrial and academic viewpoints The authors come from thirteen different countries from Europe and North America Therefore readers will get a first hand and current information about the status of computer vision research in various western countries Further this book will also be useful in understanding the current research issues in computer vision and the difficulties in designing real time vision systems *Concept for system virtualization in the field of high availability computing* Stephan Winter,2007-04-04 Bachelor Thesis from the year 2007 in the subject Computer Science Software University of Paderborn language English abstract Server virtualization is currently a field of IT which is undergoing a rapid development Introducing an even spread of performance on server farms which results in a good TCO total cost of ownership virtualization has already got the full attention from industry resulting in massive participation and huge acquisitions With server virtualization the size of server farms can be reduced dramatically resulting in a lower total cost of ownership and by using techniques like Linux HA in virtual environments increased availability Even with an overhead of 10 20% on the layer of virtualization it is still very interesting since the load on a server farm can be spread evenly which is not only a main target in server virtualization but also in distributed systems in general This work will give an insight on the current developments in the field of server

virtualization and the various techniques involved in it as well as a short historical overview about when the first types of virtualization were introduced and why they failed since according to A Tanenbaum the current hardware is not made to be virtualized The findings will mostly be supported by examples of current virtual environments especially the XEN project The paper will first introduce the different ways of virtualizing a system and in how far hardware can or can not support this The second part will introduce the current software for virtualizing a server and giving users their own separated environment starting from early approaches like BSD jails to the Linux V Server and XEN Project The last chapter will cover the use of server virtualization in high availability environments With the use of n physical machines and m virtualized systems on each machine an environment of n m x can be created where x is the level of redundancy e g x 2 for mirroring Most interesting is how virtual environments can be moved from one physical machine to another one without switching it off The summary will give some insight on the current use of virtual environments and in how far they provide advantages over solutions like Mosix Application basic virtualization and the grid It will also give an outlook on further developments especially in the field of hardware support for virtualization
