Computational Methods in Chemical Engineering with Maple Ralph E. White, Venkat R. Subramanian, 2010-02-06 This book presents Maple solutions to a wide range of problems relevant to chemical engineers and others. Many of these solutions use Maple's symbolic capability to help bridge the gap between analytical and numerical solutions. The readers are strongly encouraged to refer to the references included in the book for a better understanding of the physics involved and for the mathematical analysis. This book was written for a senior undergraduate or a first year graduate student course in chemical engineering. Most of the examples in this book were done in Maple 10. However, the codes should run in the most recent version of Maple. We strongly encourage the readers to use the classic worksheet mws option in Maple as we believe it is more user friendly and robust. In chapter one you will find an introduction to Maple which includes simple basics as a convenience for the reader such as plotting, solving linear and nonlinear equations, Laplace transformations, matrix operations, do loop and while loop. Chapter two presents linear ordinary differential equations in section 1 to include homogeneous and nonhomogeneous ODEs, solving systems of ODEs using the matrix exponential and Laplace transform method. In section two of chapter two, nonlinear ordinary differential equations are presented and include simultaneous series reactions, solving nonlinear ODEs with Maple's dsolve command, stop conditions, differential algebraic equations, and steady state solutions. Chapter three addresses boundary value problems.

Damped Wave Transport and Relaxation Kal Renganathan Sharma, 2005-11-29 Transient problems in transport phenomena have a variety of applications ranging from drug delivery systems in chemotherapy in bioengineering to heat transfer to surfaces in fluidized bed combustion, FCC boilers in mechanical engineering. However, the attention given to transient problems is disproportionate with its occurrence in the industry. Damped Wave Transport and Relaxation looks at transient problems in heat, mass, and momentum transfer, including

non Fourier effects of conduction and relaxation non Fick effects of mass diffusion and relaxation and non Newtonian effects of viscous momentum transfer and relaxation The author also reviews applications to current problems of interest and uses worked examples and illustrations to describe the manifestations of using generalized transport equations This book is intended for graduate students in transport phenomena and is an ideal reference source for industrial engineers Provides a connection with molecular phenomena Separate sections are devoted to heat mass and momentum transfer Includes exercises and examples of applications
