Zephyr RTOS Embedded C Programming Andrew Elias,2024-09-06 These days the term Real Time Operating System

RTOS is used when referring to an operating system designed for use in embedded microprocessors or controllers. The Real Time part refers to the ability to implement applications that can rapidly respond to external events in a deterministic and predictable manner. RTOS based applications have to meet strict deadline constraints while meeting the requirements of the application. One way of ensuring that urgent operations are handled reliably is to set task priorities on each task and to assign higher priorities to those tasks that need to respond in a more timely manner. Another feature of real time applications is the careful design and implementation of the communication and synchronization between the various tasks. The Zephyr RTOS was developed by Wind River Systems and subsequently open sourced. Its design and implementation are oriented towards the development of time critical IoT (Internet of Things) and IIoT (Industrial Internet of Things) applications and consequently it has a rich feature set for building both wireless and wired networking applications. However, with a rich feature set comes a fairly steep learning curve. This book covers the foundations of programming embedded systems applications using Zephyr's Kernel services. After introducing the Zephyr architecture as well as the Zephyr build and configuration processes, the book will focus on multi-tasking and inter-process communication using the Zephyr Kernel Services API. By analogy with embedded Linux programming books, this book will be akin to a Linux course that focuses on application development using the Posix API. In this case, however, it will be the Zephyr Kernel Services API that will be the API being used, as well as the Posix API features supported by Zephyr.

What You'll Learn

- An Overview of the Cortex M Architecture
- Advanced data structures and algorithms: programming linked lists, circular buffers, and lists
- How to build Zephyr Applications including setting up a Command Line Zephyr Development Environment on Linux
- Task scheduling and pre-emption patterns used in Real Time Operating Systems
- Scheduling Interrupts and Synchronization including threads scheduling and system threads
- Overview of Symmetric Multiprocessing (SMP) and Zephyr support for SMP
- Memory management including memory heaps, memory slabs, and memory pools
