Programming-Based Formal Languages and Automata Theory Marco T.

Morazán,2024 This textbook introduces formal languages and automata theory for upper level undergraduate or beginning graduate students While it contains the traditional mathematical development usually employed in computational theory courses it is also quite different from many of them Machines grammars and algorithms developed as part of a constructive proof are intended to be rendered as programs The book is divided into four parts that build on each other Part I reviews fundamental concepts It introduces programming in FSM and reviews program design In addition it reviews essential mathematical background on sets relations and reasoning about infinite sets Part II starts the study of formal languages and automata theory in earnest with regular languages It first introduces regular expressions and shows how they are used to write programs that generate words in a regular language Given that regular expressions generate words it is only natural to ask how a machine can recognize words in a regular language This leads to the study of deterministic and nondeterministic finite state machines Part III starts the exploration of languages that are not regular with context free languages It begins with context free grammars and pushdown automata to generate and recognize context free languages and it ends with a discussion of deterministic pushdown automata and illustrates why these automata are fundamentally different from nondeterministic pushdown automata Part IV eventually explores languages that are not context free known as context sensitive languages It starts by discussing the most powerful automaton known to mankind the Turing machine It then moves to grammars for context sensitive languages and their equivalence with Turing machines is explored The book ends with a brief chapter introducing complexity theory and explores the question of determining if a solution to a problem is practical
