

Human Body: Endocrine System

The endocrine system contains 9 major glands and organs that produce, store, and secrete hormones.

Brain

1 Hypothalamus

Maintains the body's homeostasis and regulates body temperature, heart rate, and blood pressure.

2 Pituitary Gland

Composed of 2 lobes: the anterior, which secretes hormones involved in the body's growth and development, and the posterior, which secretes hormones that increase the reabsorption of water into the kidneys.

3 Pineal Gland

Responsible for the production of melatonin, which plays a major role in the body's sleep-wake cycle.

Thyroid

This butterfly-shaped gland produces 3 major hormones: calcitonin, triiodothyronine (T3), and thyroxine (T4). They help regulate the body's energy and metabolism.

Parathyroid

The parathyroid, also referred to as the hypophysis, secretes hormones necessary for calcium absorption.

Thymus

The thymus controls production of T-cells (white blood cells) and plays a vital role in the body's ability to fight diseases.

Ovaries/Testes

The male and female reproductive organs release hormones responsible for blood circulation, mental vigor, and sex drive.

Ovary

Secretes estrogen and progesterone, which play a key role in the health of the female reproductive system.

Testis

Secretes testosterone, which is vital for physical development, bone density, and libido in males.

8 Pancreas

Aids in the digestion of proteins, fats, and carbohydrates. Responsible for the production of insulin and glucagon, which regulate the level of glucose in the blood.

9 Adrenal Gland

Produces hormones that allow the body to react to stress, such as adrenaline and cortisol.

Reproductive Endocrinology P. Jorge Chedrese,2009-06-13

Molecular biology emerged from advances in biochemistry during the 1940s and 1950s when the structure of the nucleic acids and proteins were elucidated Beginning in the 1970s with nucleic acid enzymology and the discovery of the restriction enzymes the tools of molecular biology became widely available and applied in cell biology to study how genes are regulated This new knowledge impacted endocrinology and reproductive biology since it was largely known that the secretion of the internal glands affected the phenotypes and expression of genes Modern reproductive biology encompasses every level of biological study from genomics to ecology encompassing cell biology biochemistry endocrinology and general physiology All of these disciplines require a basic knowledge both as a tool and as an essential aid to a fundamental understanding of the principles of life in health and disease Overall molecular biology is central to scientific studies in all living matter impacting disciplines such as medicine related health sciences veterinary agriculture and environmental sciences In this book the basic biochemistry of nucleic acids and proteins are reviewed Methodologies used to study signaling and gene regulation in the endocrine reproductive system are also discussed Topics include mechanisms of hormone action and several endocrine disorders affecting the reproductive system Professionals in the medical veterinary and animal sciences fields will find exciting and stimulating material enhancing the breadth and quality of their research
