Engineering Vibration Inman Solution 2011:

Generalized Differential and Integral Quadrature Francesco Tornabene, 2023-10-17 The main aim of this book is to analyze the mathematical fundamentals and the main features of the Generalized Differential Quadrature GDQ and Generalized Integral Quadrature GIQ techniques Furthermore another interesting aim of the present book is to show that from the two numerical techniques mentioned above it is possible to derive two different approaches such as the Strong and Weak Finite Element Methods SFEM and WFEM that will be used to solve various structural problems and arbitrarily shaped structures A general approach to the Differential Quadrature is proposed The weighting coefficients for different basis functions and grid distributions are determined Furthermore the expressions of the principal approximating polynomials and grid distributions available in the literature are shown Besides the classic orthogonal polynomials a new class of basis functions which depend on the radial distance between the discretization points is presented They are known as Radial Basis Functions or RBFs The general expressions for the derivative evaluation can be utilized in the local form to reduce the computational cost From this concept the Local Generalized Differential Quadrature LGDQ method is derived The Generalized Integral Quadrature GIQ technique can be used employing several basis functions without any restriction on the point distributions for the given definition domain To better underline these concepts some classical numerical integration schemes are reported such as the trapezoidal rule or the Simpson method An alternative approach based on Taylor series is also illustrated to approximate integrals This technique is named as Generalized Taylor based Integral Quadrature GTIQ method The major structural theories for the analysis of the mechanical behavior of various structures are presented in depth in the book In particular the strong and weak formulations of the corresponding governing equations are discussed and illustrated Generally speaking two formulations of the same system of governing equations can be developed which are respectively the strong and weak or variational formulations Once the governing equations that rule a generic structural problem are obtained together with the corresponding boundary conditions a differential system is written In particular the Strong Formulation SF of the governing equations is obtained The differentiability requirement instead is reduced through a weighted integral statement if the corresponding Weak Formulation WF of the governing equations is developed Thus an equivalent integral formulation is derived starting directly from the previous one In particular the formulation in hand is obtained by introducing a Lagrangian approximation of the degrees of freedom of the problem The need of studying arbitrarily shaped domains or characterized by mechanical and geometrical discontinuities leads to the development of new numerical approaches that divide the structure in finite elements Then the strong form or the weak form of the fundamental equations are solved inside each element The fundamental aspects of this technique which the author defined respectively Strong Formulation Finite Element Method SFEM and Weak Formulation Finite Element Method WFEM are presented in the book

Laminated Composite Doubly-Curved Shell Structures Francesco Tornabene, Michele Baccocchi, Nicholas

Fantuzzi, Eraso Viola, 2016-05-17 The title Laminated Composite Doubly Curved Shell Structures Differential and Integral Quadrature Strong Form Finite Elements illustrates the theme treated and the prospective followed during the composition of the present work The aim of this manuscript is to analyze the static and dynamic behavior of thick and moderately thick composite shells through the application of the Differential Quadrature DQ method The book is divided into two volumes wherein the principal higher order structural theories are illustrated in detail and the mechanical behavior of doubly curved structures are presented by several static and dynamic numerical applications In particular the first volume is mainly theoretical whereas the second one is mainly related to the numerical DQ technique and its applications in the structural field The numerical results reported in the present volume are compared to the one available in the literature but also to the ones obtained through several codes based on the Finite Element Method FEM Furthermore an advanced version of the DQ method termed Strong Formulation Finite Element Method SFEM is presented The SFEM solves the differential equations inside each element in the strong form and implements the mapping technique typical of the FEM

Anisotropic Doubly-Curved Shells Francesco Tornabene, Michele Baccocchi, 2019-11-01 This book aims to present in depth several Higher order Shear Deformation Theories HSDTs by means of a unified approach for the mechanical analysis of doubly curved shell structures made of anisotropic and composite materials In particular the strong and weak formulations of the corresponding governing equations are discussed and illustrated The approach presented in this volume is completely general and represents a valid tool to investigate the structural behavior of many arbitrarily shaped structures An isogeometric mapping procedure is also illustrated to this aim Special attention is given also to advanced and innovative constituents such as Carbon Nanotubes CNTs Variable Angle Tow VAT composites and Functionally Graded Materials FGMs In addition several numerical applications are developed to support the theoretical models Accurate efficient and reliable numerical techniques able to approximate both derivatives and integrals are presented which are respectively the Differential Quadrature DQ and Integral Quadrature IQ methods Finally two numerical techniques named Strong

Formulation Finite Element Method SFEM and Weak Formulation Finite Element Method WFEM are developed to deal with multi element domains characterized by arbitrary shapes and discontinuities
