Advances in Carbon Management Technologies Subhas K. Sikdar, Frank Princiotta, 2021-01-31 Volume 2 of Advances in Carbon Management Technologies has 21 chapters It presents the introductory chapter again for framing the challenges that confront the proposed solutions discussed in this volume Section 4 presents various ways biomass and biomass wastes can be manipulated to provide a low carbon footprint of the generation of power heat and co products and of recovery and reuse of biomass wastes for beneficial purposes Section 5 provides potential carbon management solutions in urban and manufacturing environments This section also provides state of the art of battery technologies for the transportation sector The chapters in section 6 deals with electricity and the grid and how decarbonization can be practiced in the electricity sector The overall topic of advances in carbon management is too broad to be covered in a book of this size It was not intended to cover every possible aspect that is relevant to the topic Attempts were made however to highlight the most important issues of decarbonization from technological viewpoints Over the years carbon intensity of products and processes has decreased but the proportion of energy derived from fossil fuels has been stubbornly stuck at about 80% This has occurred

despite very rapid development of renewable fuels because at the same time the use of fossil fuels has also increased Thus the challenges are truly daunting It is hoped that the technology choices provided here will show the myriad ways that solutions will evolve While policy decisions are the driving forces for technology development the book was not designed to cover policy solutions

Fossil fuel depletion and attempts at global warming mitigation have motivated the development of biofuels. Several feedstock and transformation pathways into biofuel have been proposed as an alternative to the usual fuels. Recently microalgae have attracted a good deal of attention because of the promise of reduced competition with food crops and lowered environmental impacts. Over the last years several life cycle assessments (LCAs) have been realized to evaluate the energy benefit and potential global warming reduction of biofuel and bioenergy produced from microalgae. This chapter presents a bibliographic review of 15 LCAs of microalgae production and/or transformation into biofuel. These studies often differ by the perimeter of the study, the functional unit and the production technologies or characteristics. Methods for environmental impact assessment and the energy balance computation also diverge. This review aims to identify the main options and variations among LCAs and concludes with some recommendations and guidelines to improve the contribution of an LCA and to facilitate comparisons among studies.

Biofuels from Algae Ashok Pandey, Duu-Jong Lee, Yusuf Chisti, Carlos R. Soccol, 2013-08-08. This book provides in depth information on basic and applied aspects of biofuels production from algae. It begins with an introduction to the topic and follows with the basic scientific aspects of algal cultivation and its use for biofuels production such as photo bioreactor engineering for microalgae production, open culture systems for biomass production and the economics of biomass production. It provides state of the art information on synthetic biology approaches for algae suitable for biofuels production followed by algal biomass harvesting, algal oils as fuels, biohydrogen production from algae, formation production of co products and more. The book also covers topics such as metabolic engineering and molecular biology for algae for fuel production, life cycle assessment and scale up and commercialization. It is highly useful and helps you to plan new research and design new economically viable processes for the production of clean fuels from algae. Covers in a comprehensive but concise way most of the algae biomass conversion technologies currently available. Lists all the products produced from algae i.e. biohydrogen, fuel oils etc. their properties and

potential uses Includes the economics of the various processes and the necessary steps for scaling them up **Biodiesel Production from Microalgae, Edible and Non-edible Oils** Prafulla Dinkarrao Patil,2010 *Microalgae and Its Potential for Biodiesel Production* Kisan Koirala,2013 Fossil fuel accounts the highest percent of primary energy consumption and used extensively for transport and other purposes since 1859 Continued use of fossil fuel are recognized as unsustainable because of depleting world reserves and the green house gas emissions associated with their use Therefore study on microalgal biofuel was performed to evaluate the potential of algal biomass as biofuel resources Also it is focused on current methods for culturing harvesting and extracting technology of microalgal biomass and economic energetic and environmental impact of biodiesel production Calculation of total energy yield per hectare per year with oil content of 30% dry weight microalgae was calculated with the values obtained from literature Also production of biodiesel per hectare per year was calculated and compared with other studies Results obtained in our study showed similar pattern with other study From our study we found that total oil yield from algal biomass is much higher than terrestrial plants and therefore microalgae have the potential to completely replace transportation petrol fuel
