PETSc for Partial Differential Equations: Numerical Solutions in C and Python Ed Bueler, 2020-10-22 The Portable Extensible Toolkit for Scientific Computation PETSc is an open source library of advanced data structures and methods for solving linear and nonlinear equations and for managing discretizations This book uses these modern numerical tools to demonstrate how to solve nonlinear partial differential equations PDEs in parallel It starts from key mathematical concepts such as Krylov space methods preconditioning multigrid and Newton's method In PETSc these components are composed at run time into fast solvers Discretizations are introduced from the beginning with an emphasis on finite difference and finite element methodologies The example C programs of the first 12 chapters listed on the inside front cover solve mostly elliptic and parabolic PDE problems Discretization leads to large sparse and generally nonlinear systems of algebraic equations For such problems mathematical solver concepts are explained and illustrated through the examples with sufficient context to speed further development PETSc for Partial Differential Equations addresses both discretizations and fast solvers for PDEs emphasizing practice more than theory Well structured examples lead to run time choices that result in high solver performance and parallel scalability The last two chapters build on the reader's understanding of fast solver concepts when applying the Firedrake Python finite element solver library This textbook the first to cover PETSc programming for nonlinear PDEs provides an on ramp for graduate students and researchers to a major area of high performance computing for science and engineering It is suitable as a supplement for courses in scientific computing or numerical methods for differential equations

Matrix Computations Gene H. Golub, Charles F. Van Loan, 1996-10-15 Revised and updated the third edition of Golub and Van Loan's classic text in computer science provides essential information about the mathematical background and algorithmic skills required for the production of numerical software This new edition includes thoroughly revised chapters on matrix multiplication problems and parallel matrix computations expanded treatment of CS decomposition an updated overview of floating point arithmetic a more accurate rendition of the modified Gram Schmidt process and new material devoted to GMRES QMR and other methods designed to handle the sparse unsymmetric linear system problem

Solving Differential Equations by Multistep Initial and Boundary Value Methods L. Brugnano, D. Trigiante, 1998-05-22 The numerical approximation of solutions of differential equations has been and continues to be one of the principal concerns of numerical analysis and is an active area of research The new generation of parallel computers have provoked a reconsideration of numerical methods This book aims to generalize classical multistep methods for both initial and boundary value problems to present a self contained theory which embraces and generalizes the classical Dahlquist theory to treat nonclassical problems such as Hamiltonian problems and the mesh selection and to select appropriate methods for a general purpose software capable of solving a wide range of

problems efficiently even on parallel computers **Computational Methods for Nanoscale Applications** Igor Tsukerman,2020-08-21 Positioning itself at the common boundaries of several disciplines this work provides new perspectives on modern nanoscale problems where fundamental science meets technology and computer modeling In addition to well known computational techniques such as finite difference schemes and Ewald summation the book presents a new finite difference calculus of Flexible Local Approximation Methods FLAME that qualitatively improves the numerical accuracy in a variety of problems **Introduction to Scientific Computing and Data Analysis** Mark H. Holmes,2023-07-11 This textbook provides an introduction to numerical computing and its applications in science and engineering The topics covered include those usually found in an introductory course as well as those that arise in data analysis This includes optimization and regression based methods using a singular value decomposition The emphasis is on problem solving and there are numerous exercises throughout the text concerning applications in engineering and science The essential role of the mathematical theory underlying the methods is also considered both for understanding how the method works as well as how the error in the computation depends on the method being used The codes used for most of the computational examples in the text are available on GitHub This new edition includes material necessary for an upper division course in computational linear algebra The Cumulative Book Index ,1997 A world list of books in the English language *Scientific and Technical Aerospace Reports* ,1989 Lists citations with abstracts for aerospace related reports obtained from world wide sources and announces documents that have recently been entered into the NASA Scientific and Technical Information Database **School Science and Mathematics** ,1908 *The Best Books for Academic Libraries: Science, technology, and agriculture* ,2002 Against the Grain ,2007 SIAM Journal on Scientific Computing ,2001 **Advanced Computing Research Institute** ,1993 **Algorithms for Approximation** J.C. Mason,M.G. Cox,1990-05-15 This volume comprises the proceedings of the second Shrivenham conference on Algorithms for Approximation The term approximation here refers to the approximation of functions and data by similar functions and leads to such topics as curve and surface fitting spline and piecewise polynomial methods finite element modelling and computer aided design Applications are given to a wide variety of areas such as surveying meteorology radar antenna and acoustic array design topography engineering metrology and CAD CAM Emphasis at the meeting was placed on the development of useful algorithms and on practical applications in defence and industry In addition some 40 submitted papers were selected and presented on a multitude of topics such as multivariate interpolation optimization methods constrained problems spline fitting data modelling and applications in microwave measurement isotropic antennas sound measurement and digitized contours **Numerical Analysis** David Ronald Kincaid,Elliott Ward Cheney,1996 This work treats numerical analysis from a mathematical point of view demonstrating that the many computational algorithms and intriguing questions of computer science arise from theorems and proofs Algorithms are developed in pseudocode with the intention of making it easy for
