Antenna Theory and Design Warren L. Stutzman, Gary A. Thiele, 2012-05-22 Stutzman's 3rd edition of *Antenna Theory and Design* provides a more pedagogical approach with a greater emphasis on computational methods. New features include additional modern material to make the text more exciting and relevant to practicing engineers, new chapters on systems, low profile elements, and base station antennas, organizational changes to improve understanding, more details on selected important topics such as microstrip antennas and arrays, and expanded measurements topic. Electromagnetics and Antenna Technology Alan J. Fenn, 2017-12-31 Written by a leading expert in the field, this practical new resource presents the fundamentals of electromagnetics and antenna technology. This book covers the design, electromagnetic simulation, fabrication, and measurements for various types of antennas, including impedance matching techniques and beamforming for ultrawideband dipoles, monopoles, loops, vector sensors for direction finding, HF curtain arrays, 3D printed nonplanar patch antenna arrays, waveguides for portable radar, reflector antennas, and other antennas. It explores the essentials of phased array antennas and includes detailed derivations of important field equations and a detailed formulation of the method of moments. This resource exhibits essential derivations of equations, providing readers with a strong foundation of the underpinnings of electromagnetics and antennas. It includes a complete chapter on the details of antenna and electromagnetic test and measurement. This book explores details on 3D printed non-planar circular patch array antenna technology and the design and analysis of a planar array fed axisymmetric Gregorian reflector. The lumped element impedance matched antennas are examined and include a look at an analytic impedance matching solution with a parallel LC network. This book provides key insight into many aspects of antenna technology that have broad applications in radar and communications. *Antenna Engineering and Radiowave Propagation with MATLAB®* Osama W. Ata, 2025-10-31 *Antenna Engineering and Radio Wave Propagation with MATLAB* offers a comprehensive simulation driven approach to designing and optimizing antennas for modern wireless systems. It combines fundamental electromagnetic principles with cutting edge innovations like reconfigurable intelligent surfaces and wearable biomedical antennas. With over 500 equations and 200 detailed figures, it seamlessly connects theoretical concepts with real world design challenges in antenna miniaturization and wireless communications. This resource covers a wide range of antenna types, including dipoles, arrays, horn antennas, and aperture antennas. It applies advanced techniques such as ray tracing, Fourier analysis, and numerical modeling to address in the field challenges. Find solutions for problems like sidelobe suppression, propagation in lossy media, compact antenna design. The book also develops satellite and 5G antenna architectures, supporting these concepts with 50 practical MATLAB codes that demonstrate array synthesis, impedance matching, and radiation pattern control. This is an essential resource for antenna engineers, RF designers, and wireless system developers across telecommunications, aerospace, and biomedical fields. It

provides solutions for critical problems such as interference mitigation wearable device design and ensuring reliable performance in complex propagation environments The book equips professionals with the knowledge to meet the demands of next generation wireless networks by offering a practical simulation driven approach to antenna design and optimization

Antenna Handbook Y.T. Lo,S. W. Lee,2013-06-29 Techniques based on the method of modal expansions the Rayleigh Stevenson expansion in inverse powers of the wavelength and also the method of moments solution of integral equations are essentially restricted to the analysis of electromagnetic radiating structures which are small in terms of the wavelength It therefore becomes necessary to employ approximations based on high frequency techniques for performing an efficient analysis of electromagnetic radiating systems that are large in terms of the wavelength One of the most versatile and useful high frequency techniques is the geometrical theory of diffraction GTD which was developed around 1951 by J B Keller 1 2 3 A class of diffracted rays are introduced systematically in the GTD via a generalization of the concepts of classical geometrical optics GO According to the GTD these diffracted rays exist in addition to the usual incident reflected and transmitted rays of GO The diffracted rays in the GTD originate from certain localized regions on the surface of a radiating structure such as at discontinuities in the geometrical and electrical properties of a surface and at points of grazing incidence on a smooth convex surface as illustrated in Fig 1 In particular the diffracted rays can enter into the GO shadow as well as the lit regions Consequently the diffracted rays entirely account for the fields in the shadow region where the GO rays cannot exist
