Inattention on Near-crash/crash Risk : an Analysis Using the 100-car Naturalistic Driving Study Data Sheila G. Klauer,2006
The results indicated that driving while drowsy results in a four to six times higher near crash crash risk relative to alert drivers Drivers engaging in visually and or manually complex tasks have a three times higher near crash crash risk than drivers who are attentive There are specific environmental conditions in which engaging in secondary tasks or driving while drowsy is more dangerous including intersections wet roadways and areas of high traffic density Short brief glances away from the forward roadway for the purpose of scanning the driving environment are safe and actually decrease near crash crash risk Even in the cases of secondary task engagement if the task is simple and requires a single short glance the risk is elevated only slightly if at all However glances totaling more than 2 seconds for any purpose increase near crash crash risk by at least two times that of normal baseline driving *The Cumulative Book Index* ,1996 A world list of books in the English language
