

Chapter 1 Lab: Using a Microscope to Estimate Size

Objectives

How can you use a microscope to estimate the size of an object?

Introduction

When you look at objects with a microscope, the objects appear to be much larger than they really are. Microscopists measure the size of the objects they are looking at.

Scientists estimate the size of microscopic objects by measuring the size of the field of view. The field of view is the area through which you can see through the microscope. The size of the field of view is related to the magnification you are using. When you increase the magnification, the field of view decreases. You can estimate the size of the field of view at different magnifications.

When you use a microscope, the diameter of the field of view is directly proportional to the magnification. The diameter of the field of view is inversely proportional to the magnification.
