**Need to know:  
Life Cycle Assessment (LCA)**

**What is a Life Cycle Assessment (LCA)?**

LCA is a tool that measures the environmental footprint of a product or service over its life. LCA provides information to help businesses understand impacts and communicate their environmental results.

**Stages in a product's life cycle**

LCA calculates a snapshot of your product's environmental impacts, including:

- What goes into the product to make it (eg. energy and raw materials)
- What comes out when the product is used and disposed of (eg. waste, water pollution, carbon)

To know the impact, we consider your product's environmental footprint.

**The Computational Structure of Life Cycle Assessment** R. Heijungs, Sangwon Suh, 2002-05-31 Life Cycle assessment LCA is a tool for environmental decision support in relation to products from the cradle to the grave Until now more emphasis has been put on the inclusion quantitative models and databases and on the design of guidebooks for applying LCA than on the integrative aspect of combining these models and data This is a remarkable thing since LCA in practice deals with thousands of quantitative data items that have to be combined in the correct manner For this one needs mathematical rules and

algorithmic principles for carrying out an LCA This book presents the first coherent treatment of the mathematical and algorithmic aspects of LCA These computational aspects are presented in matrix form so that a concise and elegant formulation is achieved This form moreover provides a platform for further extension of analysis using perturbation theory structural theory and economic input output analysis

**The Potential of Reducing Environmental Impacts of Mountain Huts** Javier Sánchez García, 2020 The background of the thesis arises from the Life European project Sustainhuts % Sustainable Mountain Huts in Europe The main goals of the project are modernization and optimization of energy generation in mountain huts This is addressed by means of automatization introduction of renewable energy sources as a substitute for fossil fuels and reduction of required energy for operation and transportation Consequently the reduction of environmental impacts is achieved which is especially important in the areas where mountain huts are located Life Cycle Assessment LCA regarding the operational phase of ten mountain huts in four countries across Europe is performed in this thesis Specifically it is focused on electricity and heat generation as well as transportation required In this way energy balance of each mountain hut is accessed at the %State Of Play at the Beginning%% SOPB and after modification of energy systems at the %State Of Play at the End%% SOPE After completing a proper preliminary study GaBi Thinkstep software is used to set up LCA models for energy generation and transportation for every mountain hut case Environmental balances of LCA models provide results regarding emissions Particularly CO<sub>2</sub> NO<sub>x</sub> SO<sub>x</sub> and particles PM are the target emissions of the study Additionally Carbon Footprint is calculated for all huts at the SOPB and the SOPE Detailed analysis of results is completed to assess the effect of the newly suggested and installed solutions on emissions to environment The results are presented for each hut and in one case the presentation of results is done more deeply to present the basic approach used Overall target emissions are reduced on average by 45% considering all the mountain huts involved in the study On account of this it can be concluded that current energy generation systems in mountain huts enable rapid improvements that are economically

feasible and have big potential in environmental impacts reductions Results offer some general conclusions that could be implemented to all other mountain huts across Europe
