Chapter 1 Test Geometry:

Modeling of Beams and Arches Made from Processed Snow and Subjected to Static Loads James M. Watt, 1969

The report describes the modeling procedures and results of static loading of structural elements made of processed snow. The general objective was to study the response of processed snow beams and arches to static loads and to formulate criteria that will make it possible to design processed snow structures to resist the airblast effects of nuclear explosions. The primary objective was to determine the response and verify the adequacy of the modeling procedures for snow structures subjected to static loadings. Author: WT-, 1960. Series consists of individual technical reports: *Penetration Into Concrete of Gamma Radiation from Fallout* W. F. Titus, 1960. The penetration into concrete of gamma radiation from fallout has been measured in an idealized geometry as a function of time after the detonation of a nuclear device. At the same time the exposure dose rate in air at heights of 3 and 9 ft above the ground was measured with two detectors suspended from a tower and shielded from above with lead so as to be sensitive primarily to radiation from fallout on the ground. For this test a sandwich made of seven concrete slabs forming a mass of concrete with face dimensions large enough to reduce edge effects to a negligible amount was buried with its top surface flush with the ground. Remote reading detectors were placed between the concrete slabs thus permitting measurements of dose rate as a function of depth in concrete. The concrete mass and the tower were located in the center of a cleared and leveled area approximately 200 yd in diameter. Thus the gamma radiation at the detectors originated from an essentially infinite plane source of radiation. Results are presented both as a function of time after detonation and of depth of penetration of the radiation into concrete. A comparison of the results with theoretical calculations is made. Author: Rheology of Fluid, Semisolid, and Solid Foods M. Anandha Rao, 2013-11-19. This revised third edition of *Rheology of Fluid Semisolid and Solid Foods* includes the following important additions: A section on microstructure. Discussion of the quantitative characterization of nanometer scale milk protein fibrils in terms of persistence and contour length. A phase diagram of a colloidal glass of hard spheres and its relationship to milk protein dispersions. Microrheology including detailed descriptions of single particle and multi particle microrheological measurements. Diffusive Wave Spectroscopy. Correlation of Bostwick consistometer data with property based dimensionless groups. A section on the effect of calcium on the morphology and functionality of whey protein nanometer scale fibrils. Discussion of how tribology and rheology can be used for the sensory perception of foods. *McGraw-Hill's SAT Study Plus* John J. Diehl, 2009-02-01.
