## Liquid pressure

1. What is the difference between the hydrostatic pressure of blood between the brain and the soles of the feet of a person whose height 165 cm (suppose the density of blood =  $1.0 \times 10^3 \text{ kg/m}^3$ , acceleration due to gravity =  $10 \text{ m/s}^2$ )

Known:

Height ( $h$ ) = 165 cm = 165/100 m = 1.65 meters

Density of bloods ( $\rho$ ) =  $1.0 \times 10^3 \text{ kg/m}^3$

Acceleration due to gravity ( $g$ ) =  $10 \text{ m/s}^2$

Wanted: liquid pressure

Solution:

$$P = \rho \cdot g \cdot h$$

## **Fluid Statics Problems And Solutions :**

**Elementary Fluid Mechanics** John K. Vennard, 2011-03-23 Fluid mechanics is the study under all possible conditions of rest and motion Its approaches analytical rational and mathematical rather than empirical it concerns itself with those basic principles which lead to the solution of numerous diversified problems and it seeks results which are widely applicable to similar fluid situations and not limited to isolated special cases Fluid mechanics recognizes no arbitrary boundaries between fields of engineering knowledge but attempts to solve all fluid problems irrespective of their occurrence or of the characteristics of the fluids involved This textbook is intended primarily for the beginner who knows the principles of mathematics and mechanics but has had no previous experience with fluid phenomena The abilities of the average beginner and the tremendous scope of fluid mechanics appear to be in conflict and the former obviously determine limits beyond which it is not feasible to go these practical limits represent the boundaries of the subject which I have chosen to call elementary fluid mechanics The apparent conflict between scope of subject and beginner ability is only along mathematical lines however and the physical ideas of fluid mechanics are well within the reach of the beginner in the field Holding to the belief that physical concepts are the sine qua non of mechanics I have sacrificed mathematical rigor and detail in developing physical pictures and in many cases have stated general laws only without numerous exceptions and limitations in order to convey basic ideas such oversimplification is necessary in introducing a new subject to the beginner Like other courses in mechanics fluid mechanics must include disciplinary features as well as factual information the beginner must follow theoretical developments develop imagination in visualizing physical phenomena and be forced to think his way through problems of theory and application The text attempts to attain these objectives in the following ways omission of subsidiary conclusions is designed to encourage the student to come to some conclusions by himself application of bare principles to specific problems should develop ingenuity illustrative problems are included to assist in overcoming numerical difficulties and many numerical problems for the student to solve are intended not only to develop ingenuity but to show practical applications as well Presentation of the subject begins with a discussion of fundamentals physical properties and fluid statics Frictionless flow is then discussed to bring out the applications of the principles of conservation of mass and energy and of impulse momentum law to fluid motion The principles of similarity and dimensional analysis are next taken up so that these principles may be used as tools in later developments Frictional processes are discussed in a semi quantitative fashion and the text proceeds to pipe and open channel flow A chapter is devoted to the principles and apparatus for fluid measurements and the text ends with an elementary treatment of flow about immersed objects
