

SACS™ Spectral Fatigue Analysis Seminar

Notes:

Topic A. File Structure and Layout

Overview - Seastate information is specified separately from the model file. This will eliminate the need for having multiple model files throughout the course of the analysis.

Topic B. Foundation Super Element

Overview - The PSI program is used to create a super element to represent the foundation. This super element will replace pile stubs, dummy piles or springs required in past analyses.

Step 1. Determine which load cases are to be used to determine the foundation stiffness. Add these load cases to a Seastate input file if necessary.

Use effective wave height and period based on center of damage of scatter diagram. Be sure that these load cases create axial load in addition to lateral load in the piles.

Step 2. Specify analysis options in the Seastate input file including load case options and allowable stress modifiers.

Don't forget to include any dummy load cases added for the foundation.

Step 3. Add foundation super element input to the PSI input file using the PILSUP line.

The load cases used to define pile head super element can be specified in Executive.
